force-app/main/default/objects/Visit__c/fields/Visit_Number__c.field-meta.xml

Salesforce metadata for Visit__c/fields/Visit_Number__c.field-meta.xml. Label: Visit Number. Type: AutoNumber. Declarative configuration, not sequential Apex execution. Formulas, validation and defaults can affect saves made by either client.

10 numbered source lines | SHA-256 a0904fe664530f618281659e6b9cd4c44c24e9a341a3c0a437ef73128c69e6f3

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<CustomField xmlns="http://soap.sforce.com/2006/04/metadata">`	Opens the CustomField block; child elements specify its configuration.
3	`    <fullName>Visit_Number__c</fullName>`	Sets API identifier used by metadata deployment and code references to Visit_Number__c.
4	`    <displayFormat>VIS-{0000}</displayFormat>`	Sets display Format in the enclosing configuration to VIS-{0000}.
5	`    <externalId>false</externalId>`	Sets whether the field is eligible for external-key matching to false.
6	`    <label>Visit Number</label>`	Sets human-readable Salesforce UI label to Visit Number.
7	`    <trackHistory>false</trackHistory>`	Sets track History in the enclosing configuration to false.
8	`    <trackTrending>false</trackTrending>`	Sets track Trending in the enclosing configuration to false.
9	`    <type>AutoNumber</type>`	Sets field/storage type to AutoNumber.
10	`</CustomField>`	Closes the CustomField configuration block.

force-app/main/default/objects/Visit__c/listViews/All_Visits.listView-meta.xml

Salesforce metadata for Visit__c/listViews/All_Visits.listView-meta.xml. Label: All Visits. Declarative configuration, not sequential Apex execution. Formulas, validation and defaults can affect saves made by either client.

7 numbered source lines | SHA-256 e169f8fc606238859e44d16ead4110634d82cb3980ccad17bc0cfd6387fe6249

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<ListView xmlns="http://soap.sforce.com/2006/04/metadata">`	Opens the ListView block; child elements specify its configuration.
3	`    <fullName>All_Visits</fullName>`	Sets API identifier used by metadata deployment and code references to All_Visits.
4	`    <columns>NAME</columns>`	Sets columns in the enclosing configuration to NAME.
5	`    <filterScope>Everything</filterScope>`	Sets filter Scope in the enclosing configuration to Everything.
6	`    <label>All Visits</label>`	Sets human-readable Salesforce UI label to All Visits.
7	`</ListView>`	Closes the ListView configuration block.

force-app/main/default/permissionsets/DMS_Allocation_Admin.permissionset-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

8 numbered source lines | SHA-256 5058995b8730f92b1d211d57f9f2a377b56ae78a8bce02fe4b53ecee6ccc019a

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<PermissionSet xmlns="http://soap.sforce.com/2006/04/metadata">`	Opens the PermissionSet block; child elements specify its configuration.
3	`    <description>Field access for managing distributor allocation and linking distributor logins. Does not grant a distributor login or broader record access.</description>`	Sets description in the enclosing configuration to Field access for managing distributor allocation and linking distributor logins. Does not grant a distributor login or broader record access..
4	`    <fieldPermissions><editable>true</editable><field>DMS_Distributor__c.Employee_Allocation_Order__c</field><readable>true</readable></fieldPermissions>`	Sets field Permissions in the enclosing configuration to <editable>true</editable><field>DMS_Distributor__c.Employee_Allocation_Order__c</field><readable>true</readable>.
5	`    <fieldPermissions><editable>true</editable><field>DMS_Distributor__c.Salesforce_User__c</field><readable>true</readable></fieldPermissions>`	Sets field Permissions in the enclosing configuration to <editable>true</editable><field>DMS_Distributor__c.Salesforce_User__c</field><readable>true</readable>.
6	`    <fieldPermissions><editable>true</editable><field>Employee__c.DMS_Distributor__c</field><readable>true</readable></fieldPermissions>`	Sets field Permissions in the enclosing configuration to <editable>true</editable><field>Employee__c.DMS_Distributor__c</field><readable>true</readable>.
7	`    <label>DMS Allocation Admin</label>`	Sets human-readable Salesforce UI label to DMS Allocation Admin.
8	`</PermissionSet>`	Closes the PermissionSet configuration block.

force-app/main/default/permissionsets/DMS_Backend_Transactions.permissionset-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

5 numbered source lines | SHA-256 9cc62bb5c51872ba8bfecf627c987d5bd8fe34ee913d55f4c075ceae3569d395

Interpret it in the enclosing object, props or type definition.
41	`readSession: async () => storedSession,`	Sets/declares the named object property or style/type member: readSession: async () => storedSession,. Interpret it in the enclosing object, props or type definition.
42	`readPending: async id => structuredClone(outboxes.get(id) || []),`	Sets/declares the named object property or style/type member: readPending: async id => structuredClone(outboxes.get(id) || []),. Interpret it in the enclosing object, props or type definition.
43	`savePending: async (id, value) => outboxes.set(id, structuredClone(value)),`	Sets/declares the named object property or style/type member: savePending: async (id, value) => outboxes.set(id, structuredClone(value)),. Interpret it in the enclosing object, props or type definition.
44	`readSnapshot: async id => snapshots.get(id),`	Sets/declares the named object property or style/type member: readSnapshot: async id => snapshots.get(id),. Interpret it in the enclosing object, props or type definition.
45	`saveSnapshot: async (id, value) => snapshots.set(id, value),`	Sets/declares the named object property or style/type member: saveSnapshot: async (id, value) => snapshots.set(id, value),. Interpret it in the enclosing object, props or type definition.
46	`};`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
47	`if (name === 'expo-crypto') return {};`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (name === 'expo-crypto') return {};.
48	`if (name.startsWith('.')) {`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (name.startsWith('.')) {.
49	`const base = path.resolve(path.dirname(file), name);`	Declares/initializes local data used by the surrounding operation: const base = path.resolve(path.dirname(file), name);. Collection contents and assignments below determine its purpose.

Line	Source code	Explanation / reading note
50	`for (const ext of ['.tsx', '.ts']) if (fs.existsSync(base + ext)) return load(base + ext);`	Repeats work over the specified records/items or while this condition holds: for (const ext of ['.tsx', '.ts']) if (fs.existsSync(base + ext)) return load(base + ext);. Check where queries/writes occur relative to the loop.
51	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
52	`return Module.prototype.require.call(mod, name);`	Returns Module.prototype.require.call(mod, name) to the caller (or begins returned UI markup) and ends this execution path.
53	`};`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
54	`mod._compile(ts.transpileModule(fs.readFileSync(file, 'utf8'), {`	Calls the named method: mod._compile(ts.transpileModule(fs.readFileSync(file, 'utf8'), {. Its implementation defines the side effect/result; use the symbol/file index to follow it.
55	`compilerOptions: {module: ts.ModuleKind.CommonJS, jsx: ts.JsxEmit.React, esModuleInterop: true, target: ts.ScriptTarget.ES2022}`	Sets/declares the named object property or style/type member: compilerOptions: {module: ts.ModuleKind.CommonJS, jsx: ts.JsxEmit.React, esModuleInterop: true, target: ts.ScriptTarget.ES2022}. Interpret it in the enclosing object, props or type definition.
56	`}).outputText, file);`	Continues the surrounding declaration/expression or text: }).outputText, file);. Read it with the preceding opening statement (compilerOptions: {module: ts.ModuleKind.CommonJS, jsx: ts.JsxEmit.React, esModuleInterop: true, target: ts.ScriptTarget.ES2022}); it is not a standalone business operation.
57	`return mod.exports;`	Returns mod.exports to the caller (or begins returned UI markup) and ends this execution path.
58	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
59	`const App = load(path.join(root, 'src/DmsApp.tsx')).default;`	Declares/initializes local data used by the surrounding operation: const App = load(path.join(root, 'src/DmsApp.tsx')).default;. Collection contents and assignments below determine its purpose.
60	`const account = {id: 'distributor-A', token: 'fixture-only-A', name: 'Fixture A'};`	Declares/initializes local data used by the surrounding operation: const account = {id: 'distributor-A', token: 'fixture-only-A', name: 'Fixture A'};. Collection contents and assignments below determine its purpose.
61	`const pending = {key: 'stable-receipt-key', path: '/transactions', label: 'Receipt', body: {action: 'receiveGoods'}};`	Declares/initializes local data used by the surrounding operation: const pending = {key: 'stable-receipt-key', path: '/transactions', label: 'Receipt', body: {action: 'receiveGoods'}};. Collection contents and assignments below determine its purpose.

Line	Source code	Explanation / reading note
62	`function reset() {`	Declares a callable function/method: function reset() {. Parameters supply its inputs; the following block implements the operation.
63	`  states = [account, {distributor: {}, retrievedAt: '2026-10-22', truncatedLists: []}, [pending], 'More'];`	Assigns the right-hand expression to the named variable/property: states = [account, {distributor: {}, retrievedAt: '2026-10-22', truncatedLists: []}, [pending], 'More'];. This is in-memory unless it is later persisted by an explicit call.
64	`  refs = []; outboxes.clear(); snapshots.clear(); calls = []; failStorage = false;`	Calls the named method: refs = []; outboxes.clear(); snapshots.clear(); calls = []; failStorage = false;. Its implementation defines the side effect/result; use the symbol/file index to follow it.
65	`  storedSession = account; outboxes.set(account.id, [pending]);`	Calls the named method: storedSession = account; outboxes.set(account.id, [pending]);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
66	`  outboxes.set('distributor-B', []);`	Calls the named method: outboxes.set('distributor-B', []);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
67	`  requestHandler = () => { throw Error('Unexpected network attempt'); };`	Assigns the right-hand expression to the named variable/property: requestHandler = () => { throw Error('Unexpected network attempt'); };. This is in-memory unless it is later persisted by an explicit call.
68	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
69	`function render() { stateIndex = 0; refIndex = 0; return App(); }`	Declares a callable function/method: function render() { stateIndex = 0; refIndex = 0; return App(); }. Parameters supply its inputs; the following block implements the operation.
70	`function find(node, predicate) {`	Declares a callable function/method: function find(node, predicate) {. Parameters supply its inputs; the following block implements the operation.
71	`  if (!node || typeof node !== 'object') return;`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!node || typeof node !== 'object') return;.
72	`  if (predicate(node)) return node;`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (predicate(node)) return node;.
73	`  for (const child of React.Children.toArray(node.props?.children)) {`	Repeats work over the specified records/items or while this condition holds: for (const child of React.Children.toArray(node.props?.children)) {. Check where queries/writes occur relative to the loop.
74	`    const match = find(child, predicate); if (match) return match;`	Declares/initializes local data used by the surrounding operation: const match = find(child, predicate); if (match) return match;. Collection contents and assignments below determine its purpose.

Line	Source code	Explanation / reading note
75	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
76	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
77	`const button = (tree, title) => find(tree, node => node.props?.title === title);`	Declares/initializes local data used by the surrounding operation: const button = (tree, title) => find(tree, node => node.props?.title === title);. Collection contents and assignments below determine its purpose.
78	`const flush = () => new Promise(resolve => setImmediate(resolve));`	Declares/initializes local data used by the surrounding operation: const flush = () => new Promise(resolve => setImmediate(resolve));. Collection contents and assignments below determine its purpose.
79	`function deferred() { let resolve, reject; const promise = new Promise((yes, no) => { resolve=yes; reject=no; }); return {promise, resolve, reject}; }`	Declares a callable function/method: function deferred() { let resolve, reject; const promise = new Promise((yes, no) => { resolve=yes; reject=no; }); return {promise, resolve, reject}; }. Parameters supply its inputs; the following block implements the operation.
80	`async function logout() { button(render(), 'Log out').props.onPress(); await flush(); }`	Waits for this asynchronous operation before continuing: async function logout() { button(render(), 'Log out').props.onPress(); await flush(); }. The returned result/error must still be handled.
81	`(async () => {`	Continues the surrounding declaration/expression or text: (async () => {. Read it with the preceding opening statement (async function logout() { button(render(), 'Log out').props.onPress(); await flush(); }); it is not a standalone business operation.
82	`  reset();`	Continues the surrounding declaration/expression or text: reset();. Read it with the preceding opening statement ((async () => {); it is not a standalone business operation.
83	`  states[3] = 'Returns';`	Assigns the right-hand expression to the named variable/property: states[3] = 'Returns';. This is in-memory unless it is later persisted by an explicit call.
84	`  let returnsTree = render();`	Declares/initializes local data used by the surrounding operation: let returnsTree = render();. Collection contents and assignments below determine its purpose.
85	`  assert.equal(find(returnsTree, node => node.props?.accessibilityLabel === 'Primary returns').props.accessibilityState.selected, true);`	Test assertion comparing an expected outcome to actual behavior: assert.equal(find(returnsTree, node => node.props?.accessibilityLabel === 'Primary returns').props.accessibilityState.selected, true);. A mismatch fails the test.
86	`  find(returnsTree, node => node.props?.accessibilityLabel === 'Secondary returns').props.onPress();`	Calls the named method: find(returnsTree, node => node.props?.accessibilityLabel === 'Secondary returns').props.onPress();. Its implementation defines the side effect/result; use the symbol/file index to follow it.

Line	Source code	Explanation / reading note
87	`  returnsTree = render();`	Assigns the right-hand expression to the named variable/property: returnsTree = render();. This is in-memory unless it is later persisted by an explicit call.
88	`  assert.equal(find(returnsTree, node => node.props?.accessibilityLabel === ' Secondary returns').props.accessibilityState.selected, true);`	Test assertion comparing an expected outcome to actual behavior: assert.equal(find(returnsTree, node => node.props?.accessibilityLabel === 'Secondary returns').props.accessibilityState.selected, true);. A mismatch fails the test.
89	`  find(returnsTree, node => node.props?.accessibilityLabel === 'Primary returns').props.onPress();`	Calls the named method: find(returnsTree, node => node.props?.accessibilityLabel === 'Primary returns').props.onPress();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
90	`  assert.equal(states[25], 'Primary');`	Test assertion comparing an expected outcome to actual behavior: assert.equal(states[25], 'Primary');. A mismatch fails the test.
91	`  assert.equal(calls.length, 0, 'Switching return tabs must not submit any transaction');`	Test assertion comparing an expected outcome to actual behavior: assert.equal(calls.length, 0, 'Switching return tabs must not submit any transaction');. A mismatch fails the test.
92	`  reset();`	Continues the surrounding declaration/expression or text: reset();. Read it with the preceding opening statement (assert.equal(calls.length, 0, 'Switching return tabs must not submit any transaction'););. It is not a standalone business operation.
93	`  states[7] = true; // background sync must not disable logout`	Assigns the right-hand expression to the named variable/property: states[7] = true; // background sync must not disable logout. This is in-memory unless it is later persisted by an explicit call.
94	`  assert.equal(button(render(), 'Log out').props.disabled, false);`	Test assertion comparing an expected outcome to actual behavior: assert.equal(button(render(), 'Log out').props.disabled, false);. A mismatch fails the test.
95	`  await logout();`	Waits for this asynchronous operation before continuing: await logout();. The returned result/error must still be handled.
96	`  assert.equal(storedSession, null);`	Test assertion comparing an expected outcome to actual behavior: assert.equal(storedSession, null);. A mismatch fails the test.
97	`  assert.equal(states[0], null); assert.equal(states[1], null);`	Test assertion comparing an expected outcome to actual behavior: assert.equal(states[0], null); assert.equal(states[1], null);. A mismatch fails the test.
98	`  assert.deepEqual(states[2], []);`	Test assertion comparing an expected outcome to actual behavior: assert.deepEqual(states[2], []);. A mismatch fails the test.
99	`  assert.deepEqual(outboxes.get(account.id), [pending]);`	Test assertion comparing an expected outcome to actual behavior: assert.deepEqual(outboxes.get(account.id), [pending]);. A mismatch fails the test.

Line	Source code	Explanation / reading note
100	`  assert.deepEqual(outboxes.get('distributor-B'), []);`	Test assertion comparing an expected outcome to actual behavior: assert.deepEqual(outboxes.get('distributor-B'), []);. A mismatch fails the test.
101	`  assert.ok(button(render(), 'Email my sign-in code'));`	Test assertion comparing an expected outcome to actual behavior: assert.ok(button(render(), 'Email my sign-in code'));. A mismatch fails the test.
102	`  assert.match(states[8], /pending changes remain saved/);`	Test assertion comparing an expected outcome to actual behavior: assert.match(states[8], /pending changes remain saved/);. A mismatch fails the test.
103	`  assert.equal(calls.length, 0);`	Test assertion comparing an expected outcome to actual behavior: assert.equal(calls.length, 0);. A mismatch fails the test.
104		Blank line separating logical sections; no executable operation.
105	`  reset();`	Continues the surrounding declaration/expression or text: reset();. Read it with the preceding opening statement; it is not a standalone business operation.
106	`  failStorage = true;`	Assigns the right-hand expression to the named variable/property: failStorage = true;. This is in-memory unless it is later persisted by an explicit call.
107	`  await logout();`	Waits for this asynchronous operation before continuing: await logout();. The returned result/error must still be handled.
108	`  assert.equal(storedSession.id, account.id);`	Test assertion comparing an expected outcome to actual behavior: assert.equal(storedSession.id, account.id);. A mismatch fails the test.
109	`  assert.equal(states[0].id, account.id);`	Test assertion comparing an expected outcome to actual behavior: assert.equal(states[0].id, account.id);. A mismatch fails the test.
110	`  assert.match(states[8], /Could not remove the saved sign-in/);`	Test assertion comparing an expected outcome to actual behavior: assert.match(states[8], /Could not remove the saved sign-in/);. A mismatch fails the test.
111	`  assert.deepEqual(outboxes.get(account.id), [pending]);`	Test assertion comparing an expected outcome to actual behavior: assert.deepEqual(outboxes.get(account.id), [pending]);. A mismatch fails the test.
112		Blank line separating logical sections; no executable operation.
113	`  for (const succeeds of [true, false]) {`	Repeats work over the specified records/items or while this condition holds: for (const succeeds of [true, false]) {. Check where queries/writes occur relative to the loop.
114	`    reset();`	Continues the surrounding declaration/expression or text: reset();. Read it with the preceding opening statement (for (const succeeds of [true, false]) {); it is not a standalone business operation.

Line	Source code	Explanation / reading note
115	`    const flight = deferred();`	Declares/initializes local data used by the surrounding operation: const flight = deferred();. Collection contents and assignments below determine its purpose.
116	`    requestHandler = () => flight.promise;`	Assigns the right-hand expression to the named variable/property: requestHandler = () => flight.promise;. This is in-memory unless it is later persisted by an explicit call.
117	`    find(render(), node => node.props?.accessibilityLabel === 'Refresh and sync').props.onPress();`	Calls the named method: find(render(), node => node.props?.accessibilityLabel === 'Refresh and sync').props.onPress();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
118	`    await flush();`	Waits for this asynchronous operation before continuing: await flush();. The returned result/error must still be handled.
119	`    assert.equal(calls.length, 1);`	Test assertion comparing an expected outcome to actual behavior: assert.equal(calls.length, 1);. A mismatch fails the test.
120	`    await logout();`	Waits for this asynchronous operation before continuing: await logout();. The returned result/error must still be handled.
121	`    if (succeeds) flight.resolve({id: 'receipt-A', status: 'Received'});`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (succeeds) flight.resolve({id: 'receipt-A', status: 'Received'});.
122	`    else flight.reject(Error('Connection lost'));`	Alternative branch taken when the preceding condition is false.
123	`    await flush();`	Waits for this asynchronous operation before continuing: await flush();. The returned result/error must still be handled.
124	`    assert.equal(states[0], null); assert.equal(states[1], null);`	Test assertion comparing an expected outcome to actual behavior: assert.equal(states[0], null); assert.equal(states[1], null);. A mismatch fails the test.
125	`    assert.deepEqual(states[2], []); assert.equal(states[23], '');`	Test assertion comparing an expected outcome to actual behavior: assert.deepEqual(states[2], []); assert.equal(states[23], '');. A mismatch fails the test.
126	`    assert.match(states[8], /Signed out/);`	Test assertion comparing an expected outcome to actual behavior: assert.match(states[8], /Signed out/);. A mismatch fails the test.
127	`    assert.equal(calls.length, 1, 'No follow-up request after logout');`	Test assertion comparing an expected outcome to actual behavior: assert.equal(calls.length, 1, 'No follow-up request after logout');. A mismatch fails the test.
128	`    assert.equal(outboxes.get(account.id).length, succeeds ? 0 : 1);`	Test assertion comparing an expected outcome to actual behavior: assert.equal(outboxes.get(account.id).length, succeeds ? 0 : 1);. A mismatch fails the test.

12	`let overrides = [],`	Declares/initializes local data used by the surrounding operation: let overrides = [],. Collection contents and assignments below determine its purpose.
13	`  stateIndex = 0;`	Assigns the right-hand expression to the named variable/property: stateIndex = 0;. This is in-memory unless it is later persisted by an explicit call.
14	`let formOverrides = [], formStateIndex = 0, formError = "";`	Declares/initializes local data used by the surrounding operation: let formOverrides = [], formStateIndex = 0, formError = "";. Collection contents and assignments below determine its purpose.
15	`let portalWidth = 390;`	Declares/initializes local data used by the surrounding operation: let portalWidth = 390;. Collection contents and assignments below determine its purpose.
16	`const portalPlatform = {OS: "web"};`	Declares/initializes local data used by the surrounding operation: const portalPlatform = {OS: "web"};. Collection contents and assignments below determine its purpose.
17	`const cache = new Map();`	Declares/initializes local data used by the surrounding operation: const cache = new Map();. Collection contents and assignments below determine its purpose.
18	`function load(file) {`	Declares a callable function/method: function load(file) {. Parameters supply its inputs; the following block implements the operation.
19	`  if (cache.has(file)) return cache.get(file).exports;`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (cache.has(file)) return cache.get(file).exports;.
20	`  const mod = new Module(file, module);`	Declares/initializes local data used by the surrounding operation: const mod = new Module(file, module);. Collection contents and assignments below determine its purpose.
21	`  mod.filename = file;`	Assigns the right-hand expression to the named variable/property: mod.filename = file;. This is in-memory unless it is later persisted by an explicit call.
22	`  mod.paths = Module._nodeModulePaths(path.dirname(file));`	Calls the named method: mod.paths = Module._nodeModulePaths(path.dirname(file));. Its implementation defines the side effect/result; use the symbol/file index to follow it.
23	`  cache.set(file, mod);`	Calls the named method: cache.set(file, mod);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
24	`  mod.require = (name) => {`	Assigns the right-hand expression to the named variable/property: mod.require = (name) => {. This is in-memory unless it is later persisted by an explicit call.
25	`    if (name.endsWith(".png")) return {uri: "nestle-logo.png"};`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (name.endsWith(".png")) return {uri: "nestle-logo.png"};.

Line	Source code	Explanation / reading note
26	`    if (name === "react-native") return file.endsWith("PortalFrame.tsx")`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (name === "react-native") return file.endsWith("PortalFrame.tsx").
27	`      ? {...native, Platform: portalPlatform, useWindowDimensions: () => ({width: portalWidth, height: 900, scale: 1, fontScale: 1})} : {...native, Platform: portalPlatform};`	Continues the surrounding declaration/expression or text: ? {...native, Platform: portalPlatform, useWindowDimensions: () => ({width: portalWidth, height: 900, scale: 1, fontScale: 1})} : {...native, Platform: portalPlatform};. Read it with the preceding opening statement (if (name === "react-native") return file.endsWith("PortalFrame.tsx")); it is not a standalone business operation.
28	`    if (name === "react" && file.endsWith("PortalFrame.tsx")) return {...React, useState: initial => [initial, () => {}]};`	Declares/uses React render state. Its setter schedules a re-render; it does not save a Salesforce record by itself.
29	`    if (name === "react" && file.endsWith("PrimaryOrderForm.tsx"))`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (name === "react" && file.endsWith("PrimaryOrderForm.tsx")).
30	`      return { ...React, useEffect: () => {}, useState: initial => {`	Declares/uses React render state. Its setter schedules a re-render; it does not save a Salesforce record by itself.
31	`        const index = formStateIndex++;`	Declares/initializes local data used by the surrounding operation: const index = formStateIndex++;. Collection contents and assignments below determine its purpose.
32	`        return [index < formOverrides.length ? formOverrides[index] : initial, value => { if(index === 1) formError = value; }];`	Returns [index < formOverrides.length ? formOverrides[index] : initial, value => { if(index === 1) formError = value; }] to the caller (or begins returned UI markup) and ends this execution path.
33	`      } };`	Continues the surrounding declaration/expression or text: } };. Read it with the preceding opening statement (return [index < formOverrides.length ? formOverrides[index] : initial, value => { if(index === 1) formError = value; }]); it is not a standalone business operation.
34	`    if (name === "react" && file.endsWith("DmsApp.tsx"))`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (name === "react" && file.endsWith("DmsApp.tsx")).
35	`      return {`	Returns { to the caller (or begins returned UI markup) and ends this execution path.
36	`        ...React,`	Continues the surrounding declaration/expression or text: ...React,. Read it with the preceding opening statement (return {); it is not a standalone business operation.
37	`        useState: (initial) =>`	Declares/uses React render state. Its setter schedules a re-render; it does not save a Salesforce record by itself.
38	`          React.useState(`	Declares/uses React render state. Its setter schedules a re-render; it does not save a Salesforce record by itself.

Line	Source code	Explanation / reading note
39	`stateIndex < overrides.length ? overrides[stateIndex++] : initial,`	Continues the surrounding declaration/expression or text: stateIndex < overrides.length ? overrides[stateIndex++] : initial,. Read it with the preceding opening statement (React.useState(); it is not a standalone business operation.
40	`),`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
41	`};`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
42	`if (name === "./api" || name === "../api")`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (name === "./api" || name === "../api").
43	`return {`	Returns { to the caller (or begins returned UI markup) and ends this execution path.
44	`request: () => {`	Sets/declares the named object property or style/type member: request: () => {. Interpret it in the enclosing object, props or type definition.
45	`throw Error("Network calls are forbidden in UI checks");`	Stops this execution path with a validation/error exception: throw Error("Network calls are forbidden in UI checks");. The caller/catch block decides how it is reported.
46	`},`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
47	`ApiError: class extends Error {},`	Declares a class/type: ApiError: class extends Error {},. Members below hold behavior and/or state.
48	`};`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
49	`if (name === "./storage" || name === "expo-crypto") return {};`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (name === "./storage" || name === "expo-crypto") return {};.
50	`if (name.startsWith(".")) {`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (name.startsWith(".")) {.
51	`const base = path.resolve(path.dirname(file), name);`	Declares/initializes local data used by the surrounding operation: const base = path.resolve(path.dirname(file), name);. Collection contents and assignments below determine its purpose.
52	`for (const ext of [".tsx", ".ts"])`	Repeats work over the specified records/items or while this condition holds: for (const ext of [".tsx", ".ts"]). Check where queries/writes occur relative to the loop.

Line	Source code	Explanation / reading note
53	`        if (fs.existsSync(base + ext)) return load(base + ext);`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (fs.existsSync(base + ext)) return load(base + ext);.
54	`      }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
55	`      return Module.prototype.require.call(mod, name);`	Returns Module.prototype.require.call(mod, name) to the caller (or begins returned UI markup) and ends this execution path.
56	`    };`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
57	`    mod._compile(`	Calls the named method: mod._compile(. Its implementation defines the side effect/result; use the symbol/file index to follow it.
58	`      ts.transpileModule(fs.readFileSync(file, "utf8"), {`	Calls the named method: ts.transpileModule(fs.readFileSync(file, "utf8"), {. Its implementation defines the side effect/result; use the symbol/file index to follow it.
59	`        compilerOptions: {`	Sets/declares the named object property or style/type member: compilerOptions: {. Interpret it in the enclosing object, props or type definition.
60	`          module: ts.ModuleKind.CommonJS,`	Sets/declares the named object property or style/type member: module: ts.ModuleKind.CommonJS,. Interpret it in the enclosing object, props or type definition.
61	`          jsx: ts.JsxEmit.React,`	Sets/declares the named object property or style/type member: jsx: ts.JsxEmit.React,. Interpret it in the enclosing object, props or type definition.
62	`          esModuleInterop: true,`	Sets/declares the named object property or style/type member: esModuleInterop: true,. Interpret it in the enclosing object, props or type definition.
63	`          target: ts.ScriptTarget.ES2022,`	Sets/declares the named object property or style/type member: target: ts.ScriptTarget.ES2022,. Interpret it in the enclosing object, props or type definition.
64	`        },`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
65	`      }).outputText,`	Continues the surrounding declaration/expression or text: }).outputText,. Read it with the preceding opening statement (},); it is not a standalone business operation.
66	`      file,`	Continues the surrounding declaration/expression or text: file,. Read it with the preceding opening statement (}).outputText,); it is not a standalone business operation.

Line	Source code	Explanation / reading note
67	`  );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
68	`  return mod.exports;`	Returns mod.exports to the caller (or begins returned UI markup) and ends this execution path.
69	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
70	`const App = load(path.join(root, "src/DmsApp.tsx")).default;`	Declares/initializes local data used by the surrounding operation: const App = load(path.join(root, "src/DmsApp.tsx")).default;. Collection contents and assignments below determine its purpose.
71	`const session = {`	Declares/initializes local data used by the surrounding operation: const session = {. Collection contents and assignments below determine its purpose.
72	`  id: "ui-only",`	Sets/declares the named object property or style/type member: id: "ui-only",. Interpret it in the enclosing object, props or type definition.
73	`  name: "Preview Distributor",`	Sets/declares the named object property or style/type member: name: "Preview Distributor",. Interpret it in the enclosing object, props or type definition.
74	`  token: "not-a-real-token",`	Sets/declares the named object property or style/type member: token: "not-a-real-token",. Interpret it in the enclosing object, props or type definition.
75	`};`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
76	`const snapshot = {`	Declares/initializes local data used by the surrounding operation: const snapshot = {. Collection contents and assignments below determine its purpose.
77	`  distributor: { Officer__r: { Name: "Preview Officer" } },`	Sets/declares the named object property or style/type member: distributor: { Officer__r: { Name: "Preview Officer" } },. Interpret it in the enclosing object, props or type definition.
78	`  retrievedAt: "2026-10-21T10:00:00Z",`	Sets/declares the named object property or style/type member: retrievedAt: "2026-10-21T10:00:00Z",. Interpret it in the enclosing object, props or type definition.
79	`  truncatedLists: [],`	Sets/declares the named object property or style/type member: truncatedLists: [],. Interpret it in the enclosing object, props or type definition.
80	`  primaryOrders: [],`	Sets/declares the named object property or style/type member: primaryOrders: [],. Interpret it in the enclosing object, props or type definition.

Line	Source code	Explanation / reading note
81	`  secondaryOrders: [],`	Sets/declares the named object property or style/type member: secondaryOrders: [],. Interpret it in the enclosing object, props or type definition.
82	`  receipts: [],`	Sets/declares the named object property or style/type member: receipts: [],. Interpret it in the enclosing object, props or type definition.
83	`  invoices: [],`	Sets/declares the named object property or style/type member: invoices: [],. Interpret it in the enclosing object, props or type definition.
84	`  inventory: [],`	Sets/declares the named object property or style/type member: inventory: [],. Interpret it in the enclosing object, props or type definition.
85	`  outlets: [],`	Sets/declares the named object property or style/type member: outlets: [],. Interpret it in the enclosing object, props or type definition.
86	`  stockChecks: [],`	Sets/declares the named object property or style/type member: stockChecks: [],. Interpret it in the enclosing object, props or type definition.
87	`};`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
88	`function render(tab, signedIn = true, data = snapshot, offline = false, needsSignIn = false, sent = false, resendSeconds = 0, extraStates = {}) {`	Declares a callable function/method: function render(tab, signedIn = true, data = snapshot, offline = false, needsSignIn = false, sent = false, resendSeconds = 0, extraStates = {}) {. Parameters supply its inputs; the following block implements the operation.
89	`  stateIndex = 0;`	Assigns the right-hand expression to the named variable/property: stateIndex = 0;. This is in-memory unless it is later persisted by an explicit call.
90	`  overrides = [signedIn ? session : null, signedIn ? data : null, [], tab, "", "", sent, false, "", offline];`	Assigns the right-hand expression to the named variable/property: overrides = [signedIn ? session : null, signedIn ? data : null, [], tab, "", "", sent, false, "", offline];. This is in-memory unless it is later persisted by an explicit call.
91	`  overrides.push("", "Product", "", {}, null, "", "", "", null, false, needsSignIn, resendSeconds);`	Calls the named method: overrides.push("", "Product", "", {}, null, "", "", "", null, false, needsSignIn, resendSeconds);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
92	`  Object.assign(overrides, extraStates);`	Calls the named method: Object.assign(overrides, extraStates);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
93	`  return renderToStaticMarkup(React.createElement(App));`	Returns renderToStaticMarkup(React.createElement(App)) to the caller (or begins returned UI markup) and ends this execution path.

scripts/verify-dms-schema.apex

Operational script: verify dms schema. Inspect commands in order before execution. Seed/backfill/reset/deploy scripts can write Salesforce records or local files; documentation generation does not execute them.

59 numbered source lines | SHA-256 fe35de0d1a71a50cd9a86f594032185232df1cdc38a9bebdc6881a466a73494b

Line	Source code	Explanation / reading note
1	`// Schema-only smoke test. Every temporary record is rolled back, even if an assertion fails.`	Developer comment/documentation: Schema-only smoke test. Every temporary record is rolled back, even if an assertion fails. It is not executed.
2	`Savepoint checkpoint = Database.setSavepoint();`	Creates a transaction checkpoint so later failure can roll back all command changes.
3	`try {`	Starts operations whose failure is handled by the following catch/finally blocks.
4	`    Product__c product = [SELECT Id FROM Product__c LIMIT 1];`	Assigns the right-hand expression to the named variable/property: Product__c product = [SELECT Id FROM Product__c LIMIT 1];. This is in-memory unless it is later persisted by an explicit call.
5	`    Employee__c employee = [SELECT Id FROM Employee__c WHERE Active__c = true LIMIT 1];`	Assigns the right-hand expression to the named variable/property: Employee__c employee = [SELECT Id FROM Employee__c WHERE Active__c = true LIMIT 1];. This is in-memory unless it is later persisted by an explicit call.
6	`    DMS_Distributor__c distributor = new DMS_Distributor__c(Name='DMS schema verification - temporary', Active__c=false);`	Assigns the right-hand expression to the named variable/property: DMS_Distributor__c distributor = new DMS_Distributor__c(Name='DMS schema verification - temporary', Active__c=false);. This is in-memory unless it is later persisted by an explicit call.
7	`    insert distributor;`	Performs Salesforce DML: insert distributor;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
8	`    DMS_Primary_Order__c primary = new DMS_Primary_Order__c(Distributor__c=distributor.Id, Employee__c=employee.Id, Status__c='Draft', Order_Date__c=Date.today());`	Calls the named method: DMS_Primary_Order__c primary = new DMS_Primary_Order__c(Distributor__c=distributor.Id, Employee__c=employee.Id, Status__c='Draft', Order_Date__c=Date.today());. Its implementation defines the side effect/result; use the symbol/file index to follow it.
9	`    insert primary;`	Performs Salesforce DML: insert primary;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
10	`    DMS_Primary_Order_Line__c primaryLine = new DMS_Primary_Order_Line__c(Order__c=primary.Id, Product__c=product.Id, Cases__c=2, Free_Cases__c=1, Pieces_Per_Case__c=20, Case_Price__c=100, Discount_Amount__c=10, Tax_Percent__c=5);`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Order_Line__c primaryLine = new DMS_Primary_Order_Line__c(Order__c=primary.Id, Product__c=product.Id, Cases__c=2, Free_Cases__c=1, Pieces_Per_Case__c=20, Case_Price__c=100, Discount_Amount. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
11	`    insert primaryLine;`	Performs Salesforce DML: insert primaryLine;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
12	`    primaryLine = [SELECT Total_Pieces__c, Net_Amount__c FROM DMS_Primary_Order_Line__c WHERE Id=:primaryLine.Id];`	Assigns the right-hand expression to the named variable/property: primaryLine = [SELECT Total_Pieces__c, Net_Amount__c FROM DMS_Primary_Order_Line__c WHERE Id=:primaryLine.Id];. This is in-memory unless it is later persisted by an explicit call.
13	`    System.assertEquals(60, primaryLine.Total_Pieces__c, 'Case conversion');`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(60, primaryLine.Total_Pieces__c, 'Case conversion');. A mismatch fails the test.
14	`    System.assertEquals(199.50, primaryLine.Net_Amount__c, 'Primary discount and tax');`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(199.50, primaryLine.Net_Amount__c, 'Primary discount and tax');. A mismatch fails the test.
15		Blank line separating logical sections; no executable operation.
16	`    DMS_Goods_Receipt__c receipt = new DMS_Goods_Receipt__c(Distributor__c=distributor.Id, Primary_Order__c=primary.Id, Received_Date__c=Date.today(), Status__c='Draft');`	Calls the named method: DMS_Goods_Receipt__c receipt = new DMS_Goods_Receipt__c(Distributor__c=distributor.Id, Primary_Order__c=primary.Id, Received_Date__c=Date.today(), Status__c='Draft');. Its implementation defines the side effect/result; use the symbol/file index to follow it.
17	`    insert receipt;`	Performs Salesforce DML: insert receipt;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
18	`    DMS_Goods_Receipt_Line__c receiptLine = new DMS_Goods_Receipt_Line__c(Goods_Receipt__c=receipt.Id, Product__c=product.Id, Batch_Number__c='SCHEMA-TEST', Received_Cases__c=2, Free_Cases__c=1, Pieces_Per_Case__c=20, Case_Cost__c=100);`	Assigns the right-hand expression to the named variable/property: DMS_Goods_Receipt_Line__c receiptLine = new DMS_Goods_Receipt_Line__c(Goods_Receipt__c=receipt.Id, Product__c=product.Id, Batch_Number__c='SCHEMA-TEST', Received_Cases__c=2, Free_Cases__c=1, Pieces_Pe. This is in-memory unless it is later persisted by an explicit call.
19	`    insert receiptLine;`	Performs Salesforce DML: insert receiptLine;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
20	`    receipt = [SELECT Total_Pieces__c, Total_Value__c FROM DMS_Goods_Receipt__c WHERE Id=:receipt.Id];`	Assigns the right-hand expression to the named variable/property: receipt = [SELECT Total_Pieces__c, Total_Value__c FROM DMS_Goods_Receipt__c WHERE Id=:receipt.Id];. This is in-memory unless it is later persisted by an explicit call.
21	`    System.assertEquals(60, receipt.Total_Pieces__c, 'Receipt quantity rollup');`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(60, receipt.Total_Pieces__c, 'Receipt quantity rollup');. A mismatch fails the test.

Line	Source code	Explanation / reading note
22	`System.assertEquals(200, receipt.Total_Value__c, 'Receipt value rollup');`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(200, receipt.Total_Value__c, 'Receipt value rollup');. A mismatch fails the test.
23		Blank line separating logical sections; no executable operation.
24	`DMS_Inventory__c stock = new DMS_Inventory__c(Distributor__c=distributor.Id, Product__c=product.Id, Batch_Number__c='SCHEMA-TEST', On_Hand_Pieces__c=60, Reserved_Pieces__c=10, Reorder_Level_Pieces__c=5);`	Assigns the right-hand expression to the named variable/property: DMS_Inventory__c stock = new DMS_Inventory__c(Distributor__c=distributor.Id, Product__c=product.Id, Batch_Number__c='SCHEMA-TEST', On_Hand_Pieces__c=60, Reserved_Pieces__c=10, Reorder_Level_Pieces__c=. This is in-memory unless it is later persisted by an explicit call.
25	`insert stock;`	Performs Salesforce DML: insert stock;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
26	`stock = [SELECT Available_Pieces__c, Low_Stock__c, Reserved_Pieces__c FROM DMS_Inventory__c WHERE Id=:stock.Id];`	Assigns the right-hand expression to the named variable/property: stock = [SELECT Available_Pieces__c, Low_Stock__c, Reserved_Pieces__c FROM DMS_Inventory__c WHERE Id=:stock.Id];. This is in-memory unless it is later persisted by an explicit call.
27	`System.assertEquals(50, stock.Available_Pieces__c, 'Available inventory');`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(50, stock.Available_Pieces__c, 'Available inventory');. A mismatch fails the test.
28	`System.assertEquals(false, stock.Low_Stock__c, 'Low stock flag');`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(false, stock.Low_Stock__c, 'Low stock flag');. A mismatch fails the test.
29	`stock.Reserved_Pieces__c=61;`	Assigns the right-hand expression to the named variable/property: stock.Reserved_Pieces__c=61;. This is in-memory unless it is later persisted by an explicit call.
30	`Database.SaveResult invalidStock=Database.update(stock,false);`	Performs Salesforce DML: Database.SaveResult invalidStock=Database.update(stock,false);. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
31	`System.assertEquals(false, invalidStock.isSuccess(), 'Reject over-reservation');`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(false, invalidStock.isSuccess(), 'Reject over-reservation');. A mismatch fails the test.

This is in-memory unless it is later persisted by an explicit call.
51	`System.assertEquals(100,invoice.Gross_Amount__c,'Invoice gross');`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(100,invoice.Gross_Amount__c,'Invoice gross');. A mismatch fails the test.
52	`System.assertEquals(10,invoice.Discount_Amount__c,'Invoice discount');`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(10,invoice.Discount_Amount__c,'Invoice discount');. A mismatch fails the test.
53	`System.assertEquals(4.50,invoice.Tax_Amount__c,'Invoice tax');`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(4.50,invoice.Tax_Amount__c,'Invoice tax');. A mismatch fails the test.
54	`System.assertEquals(94.50,invoice.Total_Amount__c,'Invoice total');`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(94.50,invoice.Total_Amount__c,'Invoice total');. A mismatch fails the test.

Line	Source code	Explanation / reading note
55	`    System.assertEquals(94.50,invoice.Balance_Due__c,'Invoice balance');`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(94.50,invoice.Balance_Due__c,'Invoice balance');. A mismatch fails the test.
56	`    System.debug('DMS_SCHEMA_SMOKE_OK: 15 assertions passed; all temporary records rolled back.');`	Calls the named method: System.debug('DMS_SCHEMA_SMOKE_OK: 15 assertions passed; all temporary records rolled back.');. Its implementation defines the side effect/result; use the symbol/file index to follow it.
57	`} finally {`	Cleanup section that runs after success or failure, for example clearing a timer or busy flag.
58	`    Database.rollback(checkpoint);`	Rolls Salesforce writes back to the saved checkpoint; prevents partial command results.
59	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

sfdx-project.json

First-party configuration & operations file: sfdx project.json. Read imports/exports and the symbol outline to locate its caller and responsibility. Detailed operations appear beside the numbered source.
