SFA Mobile & DMS

Manager walkthrough
Process, business logic and code architecture

Prepared from your local project handbook. Covers the employee app, distributor portal, backend, Salesforce classes, triggers and their relationships.

Start with this document for your demonstration. The complete companion PDF includes every numbered code explanation from the handbook: 1048 files and 34,517 source lines.

This is documentation of the 26 October 2026 snapshot, not a new deployment or a guarantee that every runtime path is tested. The verification chapter distinguishes checks that passed from remaining limitations.

Internal project documentation. Do not publish source/configuration publicly.

Reading map

1. Start here: what this project actually is

2. Folder map and reading order

3. SFA: authentication, day planning and outlets

4. SFA: GPS, visit actions, order saving and checkout

5. DMS: login, session and refresh

6. DMS: primary order and scheme algorithm

7. DMS: receipt → inventory, and why approval is not stock

8. Secondary orders, returns, tickets and allocation

9. Reports, offline behavior and deployment boundaries

10. Salesforce standards applied and remaining review work

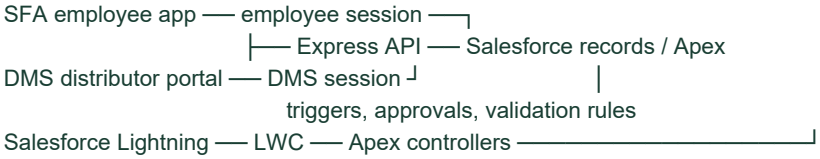
11. Manager questions: short answers to practise

12. Verification and change boundaries

Use the PDF bookmarks panel to jump directly to a topic. For a manager meeting, explain the process first; open the complete reference only when asked about a particular file or statement.

Start here: what this project actually is

This is one Salesforce data model used by two external clients: the **SFA employee mobile app** and the **DMS distributor portal/mobile client**. They share a Node/Express backend codebase. The Lightning components inside Salesforce are management screens; they are not the React Native mobile application.



Manager introduction: “The employee app records field activity. Salesforce is the central record system. The distributor portal reads the distributor’s related transactions and sends validated commands back through the backend. Primary transactions are case-based; secondary orders are usually piece-based. Approval, receipt and inventory posting are different steps.”

Use the file explorer for a numbered explanation beside every included source line. The line notes explain syntax and local operations; these chapters explain the business flow. They are not a claim that every possible runtime path was tested. Source hashes and the coverage manifest identify the exact local snapshot.

Included: first-party Apex, triggers, LWC, backend, both client source trees, Salesforce XML metadata, tests, configuration and operational scripts. Excluded: dependencies, compiled bundles, APKs, images/binaries, .env credentials, caches, diagnostics, old backups, generated data exports, lockfiles and earlier documentation. Those are not additional application logic.

Folder map and reading order

Folder	Responsibility
force-app/main/default/classes	Apex controllers, trigger services, REST commands and unit tests.
force-app/main/default/triggers	Salesforce save-event dispatchers. Before events validate/change incoming values; after events handle relationships and totals.
force-app/main/default/lwc	Three Lightning bundles: beat outlet selection, monthly PJP planning and employee picture upload.
force-app/main/default/objects	Object/field definitions, formula fields, picklists, validation rules, list views, sharing reasons and relationships.
sales-rep-mobile/backend/src	HTTP endpoints, identity checks, Salesforce transport, documents, reports and mock/test dependencies.
sales-rep-mobile/mobile/src	Employee screens, reusable fields, local drafts, sessions and offline queues.
dms-mobile/src	DMS login, desktop portal shell, orders, returns, receipts, stock, reports and sync.
scripts and launcher files	Local operation, seed/backfill and deployment utilities. Reading these is safe; running seed/reset scripts changes data.

Read in this order: SFA App.tsx → LoginScreen → api/client → backend app.ts → SalesforceService; then StoreGateScreen → VisitScreen → checkout. For DMS: App.tsx → DmsApp → api.ts → dms/router.ts → transport.ts → DmsPortalApi. Finish with triggers, handlers, metadata and tests.

Naming trap: the older `Distributor__c` is used as an SFA sales-representative record. The actual DMS distributor is `DMS_Distributor__c`. `Retailer__c` is the outlet. Labels can differ from API names; do not rename API names just to make terminology look nicer.

SFA: authentication, day planning and outlets

1. App.tsx registers the navigation screens and starts queue flushing when connectivity returns. Login is the initial screen.

2. LoginScreen collects an email, requests a code and exchanges a valid code for an employee session. The HTTP client attaches its bearer token to protected requests.

3. backend app.ts exposes login before the employee-authentication middleware. The DMS router has its own authentication and is mounted separately. Do not treat a DMS token as an employee token.

4. findEmployee resolves an active employee. The backend supplies the actor identity; clients must not be allowed to select an arbitrary employee ID to impersonate.

5. Day and attendance endpoints record start/end activity. Beats/outlets are limited by allocations. A cached list is not a fresh Salesforce read.

6. BeatsScreen and StoresScreen navigate to StoreGateScreen with the selected outlet; StoreGate refreshes the outlet so old coordinates are not the only source.

PJP flow: pjpMonthlyPlanner calls SfaPhaseOnePjpController. currentEmployee finds the logged-in Salesforce user’s employee mapping. saveDraft validates dates and authorized beats, writes a draft PJP and its PJP_Selected_Beat junction records. submitPjp checks the reporting manager and prevents self-approval. decidePjp requires the configured approver and records decision audit fields.

After approval, PjpApproverTrigger invokes SfaPjpAllocationService. It collects all selected beats, falls back to the legacy single Beat lookup when needed, locks employees, finds active outlets and creates/reactivates employee-outlet allocations. The pair key prevents repeated creation in its lookup logic. Allocation failure is not silently ignored: it can roll back the approval transaction.

BeatOutletSelectorController loads active outlets from the beat’s geography, enforces a maximum of ten selections, removes deselected assignments and assigns selected outlets. OutletGeographyTrigger copies geography and refreshes the affected old/new beat counts. PJP approval is not the same as a product-order approval.

SFA: GPS, visit actions, order saving and checkout

1. StoreGateScreen requests foreground GPS permission on the native phone and obtains the current position. In the **web preview**, the code deliberately uses the outlet's Salesforce coordinates. A successful web preview does not verify real mobile GPS.

2. The backend validates distance against the configured allowed radius. The distance helper uses the Haversine formula: convert degrees to radians, compute angular distance on a sphere and multiply by Earth's radius in metres.

3. VisitScreen starts/restores a visit and loads products. It stores form state separately from saved visit data. useMemo derives product filters and order totals; useRef retains stable request IDs across renders.

4. Brand, sub-brand and alias are derived from the selected product. Changing the selected product/filter clears dependent selection state to avoid showing another product's scheme.

5. Save action for an order first writes a local draft, then stores the draft on the visit in Salesforce. **A draft is not a submitted Sales Order.** On recovery, submitted order items take precedence over an old draft.

6. Other actions map to Product_Return, Competitor_Activity, SFA_Ticket, Stock_Check and Asset_Survey records. The backend verifies the visit belongs to the employee. Some endpoints have different retry guarantees; do not assume all writes are equally idempotent.

7. Complete Visit submits order details and checks out. The backend checks for a previously saved order and restores it rather than blindly creating another one. Salesforce composite requests request all-or-none handling and inspect individual subresponses, not just the outer HTTP 200.

8. Document services build PDF/Excel summaries. Sharing/download/email is separate from saving the order. A document-generation error does not itself prove the order was not saved.

Order header: Sales_Order__c. Product details: Order_Item__c. Parent Product__c stores the primary product for normal layouts; it is not a replacement for child lines. Product configuration minimums, selected schemes, GST and server-side product data affect the final saved amount.

Important existing limitation: the /api/store/revisit route currently returns a synthetic result; it does not persist a Salesforce revisit. The generic /api/orders/:orderId/items response also needs implementation review. These are documented as gaps, not working features.

DMS: login, session and refresh

1. DmsApp reads the stored session and the snapshot/queue keyed by distributor ID. The desktop PortalFrame and mobile navigation display the same underlying state.

2. Request-code validates/normalizes the email. The backend requires exactly one active distributor match. It uses cryptographic random six-digit codes, stores only a digest, expires them after ten minutes and limits verification attempts.

3. Resend is limited to prevent abuse. The previous challenge is replaced only after the mail send action is accepted. The generic response avoids revealing whether an email exists.

4. Verify-code compares digests with timingSafeEqual, removes the accepted challenge and rechecks the active distributor before issuing an eight-hour DMS JWT.

5. Protected DMS routes verify the token’s audience and recheck the distributor record. The body’s distributor identity is not trusted as the actor.

6. sync sends queued commands, retains failures and then fetches overview/report data. A 400 validation error requires correction; a timeout/unreachable backend leaves the saved request for retry.

7. Foreground refresh is periodic (20 seconds); reports are refreshed less frequently (about one minute unless requested). This is polling, not an instantaneous streaming subscription.

8. Logout invalidates the local session and uses generation checks so an older in-flight response cannot repopulate the next account’s screen. Pending work remains scoped to the original distributor.

Email delivery distinction: emailSimple success means Salesforce accepted the action. It does not prove Gmail delivered the message. This project previously encountered Gmail DKIM rejection; code formatting does not solve sender-domain authentication. Request-code, verify-code and email delivery are three separate checkpoints.

The OTP/rate-limit maps are process memory. Restarting the backend invalidates outstanding codes. Production multi-instance hosting needs a shared expiring store and a correctly authenticated mail sender.

DMS: primary order and scheme algorithm

1. PrimaryOrderForm loads the product catalogue, positive case prices and product-specific pieces-per-case conversions. Missing setup must not be invented by the UI.

2. The distributor selects whole cases and an applicable Primary scheme. Review is a confirmation step, not a saved order.

3. The distributor router sends distributorPrimaryOrder. The SFA employee route sends primaryOrder and derives both employee and assigned distributor from the authenticated employee session.

4. DmsTransport posts to `/services/apexrest/dms/portal/`. DmsPortalApi requires the DMS_Trusted_Backend custom permission and locks the active distributor before dispatch.

5. DmsEmployeeTransactions validates 1-50 distinct lines, positive whole quantities and stable request keys. A payload hash distinguishes a retry from reuse of the same key for different details.

6. It reads product prices/conversions from Salesforce, creates a Draft header, inserts lines and submits the configured Salesforce approval process. The assigned company Distributor Officer is the approver; the client does not choose an arbitrary approver.

7. DmsPrimaryWorkflow checks submission prerequisites, snapshots conversions/prices and makes submitted lines immutable. DmsOfficerSharing maintains read shares for the assigned officer.

Scheme qualification: active, Sales_Channel = Primary, within date limits, linked to the selected product directly or through Scheme_Product, no outlet-only restriction, and matching/unrestricted distributor geography. “No scheme” can be correct configuration behavior.

```
complete buy blocks = floor(ordered cases / minimum cases)
discount = round(cases × case price × percent / 100 + blocks × fixed discount, 2)
free cases = blocks × scheme free cases
gift quantity = blocks × configured gift quantity
```

The discount cannot exceed the paid line value. Free cases can reference another active product and must use that product’s case conversion. The server validates this again; displaying a scheme on the screen is not authorization to apply it.

Illustration only: 3 cases at ₹918 gives ₹2,754 before tax. At 5% GST and no discount, the total is ₹2,891.70. If a case contains 72 pieces, 3 cases means 216 pieces. These numbers are not universal product settings.

DMS: receipt → inventory, and why approval is not stock

Draft order → Submitted → Officer Approved
↓ actual delivery
Review goods receipt → confirm → Salesforce atomic command
↓
Receipt header + line + inventory change → Received → refreshed portal snapshot

DmsPortalApi.receiveGoods first checks whether the request key has already saved this exact receipt. If so it returns the original ID. If the same key describes different details, it rejects it. It then validates paid/free kind, whole cases, batch and expiry.

The order line must belong to this distributor and an Approved order. The server sums earlier received quantities, compares them with the paid/free entitlement and rejects over-receipt. It locks matching inventory for the distributor/product/batch and requires the existing batch expiry to match.

In one transaction it inserts a Draft receipt, inserts its line, adds `received cases × pieces per case` to stock, and marks the receipt Received. The outer savepoint rolls back partial changes on failure. Paid receipt case cost subtracts the allocated discount per case; free goods have zero purchase cost.

The app keeps the queued command until the API returns a valid saved ID/status. It reloads overview and stock; “pending” is not a saved receipt. A disabled receive button can indicate an exhausted approved quantity, a busy sync or invalid input. Read the actual condition beside the button in DmsApp before diagnosing it.

Directly creating arbitrary receipt records through the Salesforce UI is not automatically equivalent to calling this posting service. The inventory update shown here belongs to receiveGoods. Do not claim an inventory trigger handles every possible manual edit.

Secondary orders, returns, tickets and allocation

Secondary orders: employees save outlet Sales_Order records through SFA. DmsSecondaryRouting derives DMS_Distributor from the outlet and rejects an inconsistent/inactive supplier. Newly routed Sales_Order records receive Approved status, decision notes and timestamp automatically. Returns remain Pending. The portal no longer presents order approval/rejection controls, but older server decision methods remain in the codebase; hiding buttons is not endpoint retirement.

Auto-approval is not an invoice, physical shipment or automatic inventory deduction. Read invoice/stock-posting code and metadata separately before claiming dispatch is automated.

Primary returns: employee entry references a received goods-receipt line. The server locks receipts, sums non-rejected returns, checks remaining received cases and validates Damaged/Expired/Delayed Delivery/No Demand/Other. Other requires notes. It snapshots original receipt values and submits the company-officer return approval process. Primary and secondary return views are distinct in DMS.

Secondary returns: Product_Return records originate from outlet visits, normally in pieces. The outlet-to-distributor relationship routes them into DMS for the distributor's decision. Do not confuse an employee return with the distributor's own company-level return.

Tickets: DMS_Support_Ticket is distributor support, separate from outlet SFA_Ticket. DmsTicketRules stamps Open/Officer/Owner on creation. Open → In Progress or Rejected; In Progress → Closed or Rejected. Terminal decisions need resolution text. Only the assigned officer or DMS_Manage_Tickets permission can change the status.

Round-robin: DmsEmployeeAllocator selects active distributors ordered by Allocation_Order, locks the persistent allocation-state record, assigns each unassigned employee to the next distributor and wraps to the first. The cursor and employee changes commit together. Missing state is a configuration error; no active pool leaves allocation unchanged. Existing employee assignments are not randomly overwritten.

Discontinued: the lifecycle handler forces Active false when Discontinued is selected. Clearing the checkbox does not silently reactivate the login. History remains.

Reports, offline behavior and deployment boundaries

dashboard.ts collects distributor-scoped activity. reports.ts queries the full paginated record sets and calculates periods in Asia/Kolkata. Booked secondary sales are Submitted/Fulfilled orders excluding distributor rejection; this is not invoiced revenue or sales net of returns. Product breakdown uses line values while headers may include tax.

- Sales achievement = booked sales / configured target. Missing target is represented as unavailable, not a false 0% achievement. Web DMS hides sales-vs-target; native rendering retains the relevant report branch.

- Beat productivity distinguishes planned, visited and productive outlets. A productive outlet has a qualifying visit linked to an order.

- Outlet coverage counts active buyers against active assigned outlets. A visit alone is not necessarily a buyer.

- Stock metrics distinguish on-hand, available, low stock, expiry and no recent movement.

- Purchased-vs-sold uses posted receipt/invoice data; an approved purchase order alone is not purchased stock.

DMS session tokens use SecureStore on native and AsyncStorage on web. Snapshot and queue keys include distributor ID. SFA has a generic queue and a separate primary queue; the generic queue key is global and should receive an account-isolation/concurrency review. Offline support is limited to cached information and implemented queued actions. Authentication and uncached data still need a connection.

DMS local web is normally port 8082, DMS backend 4001 via its launcher, and SFA commonly 8081/4000. DMS api.ts has a web fallback of 4000, so the launcher/build environment must set the DMS URL correctly. On a phone, localhost means the phone, not the computer.

Start-DmsLocal builds/starts local services; Keep-DmsLocalRunning checks the ports and restarts missing processes; Open-DmsPortal launches the page; Install-DmsAutoStart installs per-user shortcuts. These do not make a laptop into permanent cloud hosting. Sleep/shutdown, expired Salesforce authorization, unavailable internet or email-provider rejection still affect the service.

Salesforce standards applied and remaining review work

This pass improves maintainability, not provenance: readable names, formatting and comments do not make AI-assisted code “human-authored.” No artificial mistakes or authorship claims were added.

- Consistent four-space Apex formatting and a pinned formatter with debug-check.

- Three thin triggers now delegate lifecycle, survey and target-key rules to named handlers with descriptive variables.

- Handler sharing choices explicitly preserve system-trigger behavior; the survey still checks the actual assigned officer.

- Added focused handler tests for a 200-row batch, one-query survey validation and historical-officer preservation.

- Repaired local missing semicolon/closing braces. Repaired legacy REST compilation issues without changing its JSON envelope: Exception suffix, void response serialization and an approval variable that shadowed the Approval type.

- Formatted first-party TypeScript/TSX and LWC without changing API names or intended logic. One test file was deliberately excluded because the formatter reported an unstable layout.

Not a complete security certification. Remaining review items:

- Employee__c still has two triggers (allocation and invitation). Salesforce does not promise their relative execution order. Consolidation requires a separately reviewed deployment; merely deleting a local trigger would not delete it from the org.

- with sharing governs record visibility, not CRUD/FLS. Older Aura controllers and system-mode paths need endpoint-by-endpoint permission review before production.

- The current portal API has a trusted-backend permission guard; the legacy DmsTransactionApi does not use that same guard. Do not expose the legacy endpoint to distributor users.

- Older PjpPlannerController.decidePlan does not contain the explicit assigned-approver check found in SfaPhaseOnePjpController.decidePjp. The retained LWC imports the latter; review access to the legacy controller separately.

- Invitation email results use partial-success sending without fully reporting all results; SfaSalesRepresentativeInvitationService escapes quotes, not full HTML. Localhost and pinned APK invitation URLs need environment configuration.

- Generic SFA queue dependency/concurrency behavior, broad CORS, remaining any types and large controller files merit focused follow-up work with tests.

- Deployment tests, object permissions, integration-user least privilege, sender authentication and device testing are separate checks. See the verification section for what actually ran.

References: Salesforce bulk trigger guidance; Salesforce Apex security; Apex formatter and debug-check. The local standards document is also retained.

Manager questions: short answers to practise

Why use a backend instead of putting Salesforce credentials in the APK?

The backend holds the integration credentials and applies employee/distributor scope. The phone receives an application session, not the org credential.

Why are there primary and secondary orders?

Primary is company-to-distributor in cases with company-officer approval. Secondary is distributor-to-outlet, generally in pieces, captured by employees and automatically approved under the current routing rule.

Why use Map and Set in Apex?

Set collects unique IDs; Map looks up related records without querying for each row. The handler queries the batch once and processes it in memory.

Why FOR UPDATE?

It locks records during decisions that must be serialized, such as allocation cursors, receipt quantities and inventory posting. It prevents two concurrent requests using the same old balance.

What is idempotency?

Retrying the same stable request returns the saved result rather than creating a duplicate. The payload must match; a new business operation needs a new key.

Why is a record visible in Salesforce but not in DMS?

Check the signed-in distributor, lookup relationships, status/query filters, permissions and last successful snapshot refresh. Do not immediately create another record.

Why not add stock when the officer approves?

Approval authorizes the purchase. Stock represents goods actually received; receiveGoods posts the receipt and pieces together.

Why does a scheme not appear?

Check Primary channel, active flag, dates, product linkage, geography, outlet-only restriction and case minimum. A secondary scheme is not automatically a valid primary scheme.

Does HTTP 200 mean everything saved?

No. Inspect the success envelope and Salesforce composite subresponses. The transport rejects invalid IDs/statuses and returned errors.

What is before versus after trigger?

Before changes the incoming record or adds validation errors without separate DML on it. After has saved IDs for related records, shares and totals.

Does with sharing enforce field security?

No. CRUD/FLS needs separate enforcement or a deliberate, documented trusted-system design.

Can I promise zero errors or always-online localhost?

No. Explain tested paths and dependencies. Local services need the computer; production needs suitable hosting, persistent state, monitoring, authenticated email and permissions.

Demo order: show distributor/employee/outlet relationships in Salesforce → sign into the correct client → show fresh catalogue and stock → place/review a primary order → show Salesforce header and product lines → officer decision → receive an approved line → show saved receipt and refreshed stock → show SFA secondary activity in DMS → show a return/ticket → explain sync status. Do not approve or create real transactions only to illustrate the guide.

Verification and change boundaries

Check	Observed result on 26 October 2026
Salesforce check-only deployment	0AfjV000004xhxuSAA · Succeeded · 50 tests completed, 0 failures. Classes and triggers validated against sfaNewOrg. Check-only: no deployed code change.
Backend	39 tests passed; 8 skipped; TypeScript build passed. Local fixtures/mocks, not end-to-end email delivery.
SFA mobile	26 tests passed; TypeScript check passed.
DMS	UI, desktop/native navigation, logout, account-isolation and rejected-receipt correction scripts passed; TypeScript check passed. No real network calls in UI scripts.
Formatter	Apex debug-check passed before write. TS/LWC debug-check passed except visitRecovery.test.ts (formatter layout instability); that test was left unchanged.

Backups: backups/code-readability-20261026. No actual metadata deployment, record creation, approval, email sending, APK release or Git push was performed for this explanation task. Newly added handler classes/trigger dispatch changes must be deployed together after review.

Runtime code changes were limited to extracting three existing trigger rules and repairing the identified Apex compilation errors. Other changes are formatting. No wholesale claim of production/security compliance is made.

Complete numbered code reference

All included first-party source and metadata from the existing handbook. Use the bookmarks panel to select an area and file. Each source row retains its original local line number. Long code lines wrap inside the source column; wrapping does not create a new source line.

How to read: Code is on the left; the reading note is on the right. Multi-line statements must be read together. Generated line notes explain syntax/local operations; the preceding manager chapters explain business intent. They are not a separate manual correctness proof for every line.

Excluded from the original snapshot: credentials, installed dependencies, compiled output/APKs, binaries, old backups and generated data exports. These PDFs do not change or deploy any application code.

Source coverage: 1048 files / 34,517 lines. The appended pages use landscape orientation for code readability.

Apex classes & tests

74 files. Expand this area in the PDF bookmarks to jump to an individual file.

force-app/main/default/classes/BeatOutletSelectorController.cls

Loads active geography-matching outlets and saves a maximum of ten beat assignments, clearing removed selections. Called by beatOutletSelector LWC.

135 numbered source lines | SHA-256 8eff30c2a09c14f62bafda85c3e513e9ebd4b480b1d94cfe4442c62d86e34407

force-app/main/default/classes/BeatOutletSelectorController.cls-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

5 numbered source lines | SHA-256 991f1ca647a6d030b8f1828ad18737c5e94ecbe63a944a972fd685c6ab98f84a

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<ApexClass xmlns="http://soap.sforce.com/2006/04/metadata">`	Opens the ApexClass block; child elements specify its configuration.
3	`    <apiVersion>65.0</apiVersion>`	Sets Salesforce API version used for this component to 65.0.
4	`    <status>Active</status>`	Sets component activation status to Active.
5	`</ApexClass>`	Closes the ApexClass configuration block.

force-app/main/default/classes/BeatOutletSelectorControllerTest.cls

Regression tests for BeatOutletSelectorController. Fixture setup creates inputs, the action invokes behavior, and assertions compare actual results to expected outcomes. Tests with stubs do not verify the real mail provider or Salesforce transport.

94 numbered source lines | SHA-256 658a4edc61e4cf55e0f987bbe2fe2456d9c42a1f818304859e880938c106ac54

65	`        Test.stopTest();`	Ends the Apex test window and runs queued test asynchronous work before checking outcomes.
66		Blank line separating logical sections; no executable operation.
67	`        System.assertEquals(11, data.options.size(), 'Only MG Road outlets should be available.');`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(11, data.options.size(), 'Only MG Road outlets should be available.');. A mismatch fails the test.
68	`        System.assertEquals(10, savedCount);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(10, savedCount);. A mismatch fails the test.

Line	Source code	Explanation / reading note
69	`Beat__c refreshedBeat = [SELECT Outlet_Count__c FROM Beat__c WHERE Id = :beat.Id];`	Assigns the right-hand expression to the named variable/property: Beat__c refreshedBeat = [SELECT Outlet_Count__c FROM Beat__c WHERE Id = :beat.Id];. This is in-memory unless it is later persisted by an explicit call.
70	`System.assertEquals(10, refreshedBeat.Outlet_Count__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(10, refreshedBeat.Outlet_Count__c);. A mismatch fails the test.
71	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
72		Blank line separating logical sections; no executable operation.
73	`@IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
74	`static void rejectsMoreThanTenOutlets() {`	Continues the surrounding declaration/expression or text: static void rejectsMoreThanTenOutlets() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.
75	`Beat__c beat = [SELECT Id FROM Beat__c WHERE Name = 'MG Road Test Beat'];`	Assigns the right-hand expression to the named variable/property: Beat__c beat = [SELECT Id FROM Beat__c WHERE Name = 'MG Road Test Beat'];. This is in-memory unless it is later persisted by an explicit call.
76	`List<Id> outletIds = new List<Id>();`	Declares/initializes local data used by the surrounding operation: List<Id> outletIds = new List<Id>();. Collection contents and assignments below determine its purpose.
77	`for (Retailer__c outlet : [`	Repeats work over the specified records/items or while this condition holds: for (Retailer__c outlet : [. Check where queries/writes occur relative to the loop.
78	`SELECT Id`	Selects these Salesforce fields/aggregates: Id. Query results are used in the surrounding assignment or loop.
79	`FROM Retailer__c`	Chooses the Salesforce object/subquery source: FROM Retailer__c.
80	`WHERE Geography__r.Name = 'MG Road Geography'`	Adds a query/filter condition: WHERE Geography__r.Name = 'MG Road Geography'. The complete condition determines which records are included.
81	`])`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
82	`outletIds.add(outlet.Id);`	Calls the named method: outletIds.add(outlet.Id);. Its implementation defines the side effect/result; use the symbol/file index to follow it.

Line	Source code	Explanation / reading note
83		Blank line separating logical sections; no executable operation.
84	`        Test.startTest();`	Starts the isolated Apex test execution window and resets the relevant governor-limit counters.
85	`        Boolean limitWasEnforced = false;`	Declares/initializes local data used by the surrounding operation: Boolean limitWasEnforced = false;. Collection contents and assignments below determine its purpose.
86	`        try {`	Starts operations whose failure is handled by the following catch/finally blocks.
87	`            BeatOutletSelectorController.saveSelection(beat.Id, outletIds);`	Calls the named method: BeatOutletSelectorController.saveSelection(beat.Id, outletIds);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
88	`        } catch (AuraHandledException expected) {`	Handles an exception from the preceding try block. Check whether it rolls back, preserves queued work or only displays an error.
89	`            limitWasEnforced = true;`	Assigns the right-hand expression to the named variable/property: limitWasEnforced = true;. This is in-memory unless it is later persisted by an explicit call.
90	`        }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
91	`        Test.stopTest();`	Ends the Apex test window and runs queued test asynchronous work before checking outcomes.
92	`        System.assert(limitWasEnforced, 'Expected the maximum outlet validation.');`	Test assertion comparing an expected outcome to actual behavior: System.assert(limitWasEnforced, 'Expected the maximum outlet validation.');. A mismatch fails the test.
93	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
94	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

force-app/main/default/classes/BeatOutletSelectorControllerTest.cls-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

16	`            );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
17	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
18	`    private static DmsPortalApi.Command fixture() {`	Declares a callable function/method: private static DmsPortalApi.Command fixture() {. Parameters supply its inputs; the following block implements the operation.
19	`        DMS_Distributor__c distributor = new DMS_Distributor__c(`	Assigns the right-hand expression to the named variable/property: DMS_Distributor__c distributor = new DMS_Distributor__c(. This is in-memory unless it is later persisted by an explicit call.
20	`            Name = 'Self service test',`	Assigns the right-hand expression to the named variable/property: Name = 'Self service test',. This is in-memory unless it is later persisted by an explicit call.
21	`            Active__c = true,`	Assigns the right-hand expression to the named variable/property: Active__c = true,. This is in-memory unless it is later persisted by an explicit call.
22	`            Officer__c = UserInfo.getUserId()`	Calls the named method: Officer__c = UserInfo.getUserId(). Its implementation defines the side effect/result; use the symbol/file index to follow it.
23	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

Line	Source code	Explanation / reading note
24	`insert distributor;`	Performs Salesforce DML: insert distributor;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
25	`Product__c product = new Product__c(`	Assigns the right-hand expression to the named variable/property: Product__c product = new Product__c(. This is in-memory unless it is later persisted by an explicit call.
26	`Name = 'Test cases',`	Assigns the right-hand expression to the named variable/property: Name = 'Test cases',. This is in-memory unless it is later persisted by an explicit call.
27	`Product_Code__c = 'SELF-TEST',`	Assigns the right-hand expression to the named variable/property: Product_Code__c = 'SELF-TEST',. This is in-memory unless it is later persisted by an explicit call.
28	`MRP__c = 20,`	Assigns the right-hand expression to the named variable/property: MRP__c = 20,. This is in-memory unless it is later persisted by an explicit call.
29	`Retailer_Base_Price__c = 15,`	Assigns the right-hand expression to the named variable/property: Retailer_Base_Price__c = 15,. This is in-memory unless it is later persisted by an explicit call.
30	`Units_Per_Case__c = 10,`	Assigns the right-hand expression to the named variable/property: Units_Per_Case__c = 10,. This is in-memory unless it is later persisted by an explicit call.
31	`DMS_Case_Price__c = 100,`	Assigns the right-hand expression to the named variable/property: DMS_Case_Price__c = 100,. This is in-memory unless it is later persisted by an explicit call.
32	`GST_Percent__c = 5,`	Assigns the right-hand expression to the named variable/property: GST_Percent__c = 5,. This is in-memory unless it is later persisted by an explicit call.
33	`Active__c = true,`	Assigns the right-hand expression to the named variable/property: Active__c = true,. This is in-memory unless it is later persisted by an explicit call.
34	`Sellable__c = true`	Assigns the right-hand expression to the named variable/property: Sellable__c = true. This is in-memory unless it is later persisted by an explicit call.
35	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
36	`insert product;`	Performs Salesforce DML: insert product;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
37	`Scheme__c scheme = new Scheme__c(`	Assigns the right-hand expression to the named variable/property: Scheme__c scheme = new Scheme__c(. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
38	`Name = 'Primary test offer',`	Assigns the right-hand expression to the named variable/property: Name = 'Primary test offer',. This is in-memory unless it is later persisted by an explicit call.
39	`Scheme_Code__c = 'SELF-OFFER',`	Assigns the right-hand expression to the named variable/property: Scheme_Code__c = 'SELF-OFFER',. This is in-memory unless it is later persisted by an explicit call.
40	`Start_Date__c = Date.today(),`	Calls the named method: Start_Date__c = Date.today(),. Its implementation defines the side effect/result; use the symbol/file index to follow it.
41	`End_Date__c = Date.today().addDays(5),`	Calls the named method: End_Date__c = Date.today().addDays(5),. Its implementation defines the side effect/result; use the symbol/file index to follow it.
42	`Scheme_Type__c = 'Same Product Free',`	Assigns the right-hand expression to the named variable/property: Scheme_Type__c = 'Same Product Free',. This is in-memory unless it is later persisted by an explicit call.
43	`Sales_Channel__c = 'Primary',`	Assigns the right-hand expression to the named variable/property: Sales_Channel__c = 'Primary',. This is in-memory unless it is later persisted by an explicit call.
44	`Product__c = product.Id,`	Assigns the right-hand expression to the named variable/property: Product__c = product.Id,. This is in-memory unless it is later persisted by an explicit call.
45	`Active__c = true,`	Assigns the right-hand expression to the named variable/property: Active__c = true,. This is in-memory unless it is later persisted by an explicit call.
46	`Minimum_Cases__c = 2,`	Assigns the right-hand expression to the named variable/property: Minimum_Cases__c = 2,. This is in-memory unless it is later persisted by an explicit call.
47	`Free_Cases__c = 1,`	Assigns the right-hand expression to the named variable/property: Free_Cases__c = 1,. This is in-memory unless it is later persisted by an explicit call.
48	`Discount_Percent__c = 10`	Assigns the right-hand expression to the named variable/property: Discount_Percent__c = 10. This is in-memory unless it is later persisted by an explicit call.
49	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
50	`insert scheme;`	Performs Salesforce DML: insert scheme;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
51	`DmsPortalApi.Command cmd = new DmsPortalApi.Command();`	Calls the named method: DmsPortalApi.Command cmd = new DmsPortalApi.Command();. Its implementation defines the side effect/result; use the symbol/file index to follow it.

Line	Source code	Explanation / reading note
52	`cmd.action = 'distributorPrimaryOrder';`	Assigns the right-hand expression to the named variable/property: cmd.action = 'distributorPrimaryOrder';. This is in-memory unless it is later persisted by an explicit call.
53	`cmd.distributorId = distributor.Id;`	Assigns the right-hand expression to the named variable/property: cmd.distributorId = distributor.Id;. This is in-memory unless it is later persisted by an explicit call.
54	`cmd.requestKey = 'distributor-order-123456';`	Assigns the right-hand expression to the named variable/property: cmd.requestKey = 'distributor-order-123456';. This is in-memory unless it is later persisted by an explicit call.
55	`DmsEmployeeTransactions.LineInput line = new DmsEmployeeTransactions.LineInput();`	Calls the named method: DmsEmployeeTransactions.LineInput line = new DmsEmployeeTransactions.LineInput();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
56	`line.productId = product.Id;`	Assigns the right-hand expression to the named variable/property: line.productId = product.Id;. This is in-memory unless it is later persisted by an explicit call.
57	`line.cases = 4;`	Assigns the right-hand expression to the named variable/property: line.cases = 4;. This is in-memory unless it is later persisted by an explicit call.
58	`line.schemeId = scheme.Id;`	Assigns the right-hand expression to the named variable/property: line.schemeId = scheme.Id;. This is in-memory unless it is later persisted by an explicit call.
59	`cmd.lines = new List<DmsEmployeeTransactions.LineInput>{ line };`	Assigns the right-hand expression to the named variable/property: cmd.lines = new List<DmsEmployeeTransactions.LineInput>{ line };. This is in-memory unless it is later persisted by an explicit call.
60	`return cmd;`	Returns cmd to the caller (or begins returned UI markup) and ends this execution path.
61	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
62	`private static Map<String, Object> call(DmsPortalApi.Command cmd) {`	Declares a callable function/method: private static Map<String, Object> call(DmsPortalApi.Command cmd) {. Parameters supply its inputs; the following block implements the operation.
63	`RestContext.request = new RestRequest();`	Assigns the right-hand expression to the named variable/property: RestContext.request = new RestRequest();. This is in-memory unless it is later persisted by an explicit call.
64	`RestContext.response = new RestResponse();`	Assigns the right-hand expression to the named variable/property: RestContext.response = new RestResponse();. This is in-memory unless it is later persisted by an explicit call.
65	`RestContext.request.requestBody = Blob.valueOf(JSON.serialize(cmd));`	Converts structured data to JSON for HTTP, persistent storage or a fingerprint.

Line	Source code	Explanation / reading note
66	`        System.runAs(new User(Id = UserInfo.getUserId())) {`	Calls the named method: System.runAs(new User(Id = UserInfo.getUserId())) {. Its implementation defines the side effect/result; use the symbol/file index to follow it.
67	`            DmsPortalApi.execute();`	Calls the named method: DmsPortalApi.execute();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
68	`        }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
69	`        return (Map<String, Object>) JSON.deserializeUntyped(`	Converts JSON into structured data. Invalid JSON can throw; inspect validation and catch handling.
70	`            RestContext.response.responseBody.toString()`	Calls the named method: RestContext.response.responseBody.toString(). Its implementation defines the side effect/result; use the symbol/file index to follow it.
71	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
72	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
73	`    @IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
74	`    static void distributorOrderSchemesApprovalAndReplay() {`	Continues the surrounding declaration/expression or text: static void distributorOrderSchemesApprovalAndReplay() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.
75	`        DmsPortalApi.Command cmd = fixture();`	Assigns the right-hand expression to the named variable/property: DmsPortalApi.Command cmd = fixture();. This is in-memory unless it is later persisted by an explicit call.
76	`        Test.startTest();`	Starts the isolated Apex test execution window and resets the relevant governor-limit counters.
77	`        Map<String, Object> result = call(cmd);`	Declares/initializes local data used by the surrounding operation: Map<String, Object> result = call(cmd);. Collection contents and assignments below determine its purpose.
78	`        System.assertNotEquals(null, result.get('id'), JSON.serialize(result));`	Test assertion comparing an expected outcome to actual behavior: System.assertNotEquals(null, result.get('id'), JSON.serialize(result));. A mismatch fails the test.

Line	Source code	Explanation / reading note
79	`System.assertEquals('Submitted', result.get('status'));`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals('Submitted', result.get('status'));. A mismatch fails the test.
80	`Id orderId = (Id) result.get('id');`	Declares/initializes local data used by the surrounding operation: Id orderId = (Id) result.get('id');. Collection contents and assignments below determine its purpose.
81	`DMS_Primary_Order__c order = [`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Order__c order = [. This is in-memory unless it is later persisted by an explicit call.
82	`SELECT Employee__c, Order_Source__c, Officer__c, Total_Amount__c`	Selects these Salesforce fields/aggregates: Employee__c, Order_Source__c, Officer__c, Total_Amount__c. Query results are used in the surrounding assignment or loop.
83	`FROM DMS_Primary_Order__c`	Chooses the Salesforce object/subquery source: FROM DMS_Primary_Order__c.
84	`WHERE Id = :orderId`	Adds a query/filter condition: WHERE Id = :orderId. The complete condition determines which records are included.
85	`];`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
86	`System.assertEquals(null, order.Employee__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(null, order.Employee__c);. A mismatch fails the test.
87	`System.assertEquals('Distributor DMS', order.Order_Source__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals('Distributor DMS', order.Order_Source__c);. A mismatch fails the test.
88	`System.assertEquals(378, order.Total_Amount__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(378, order.Total_Amount__c);. A mismatch fails the test.
89	`System.assertEquals(UserInfo.getUserId(), order.Officer__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(UserInfo.getUserId(), order.Officer__c);. A mismatch fails the test.
90	`DMS_Primary_Order_Line__c line = [`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Order_Line__c line = [. This is in-memory unless it is later persisted by an explicit call.
91	`SELECT Free_Cases__c, Discount_Amount__c, Scheme__c`	Selects these Salesforce fields/aggregates: Free_Cases__c, Discount_Amount__c, Scheme__c. Query results are used in the surrounding assignment or loop.
92	`FROM DMS_Primary_Order_Line__c`	Chooses the Salesforce object/subquery source: FROM DMS_Primary_Order_Line__c.
93	`WHERE Order__c = :orderId`	Adds a query/filter condition: WHERE Order__c = :orderId. The complete condition determines which records are included.

Line	Source code	Explanation / reading note
94	`];`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
95	`System.assertEquals(2, line.Free_Cases__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(2, line.Free_Cases__c);. A mismatch fails the test.
96	`System.assertEquals(40, line.Discount_Amount__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(40, line.Discount_Amount__c);. A mismatch fails the test.
97	`ProcessInstanceWorkitem work = [`	Assigns the right-hand expression to the named variable/property: ProcessInstanceWorkitem work = [. This is in-memory unless it is later persisted by an explicit call.
98	`SELECT Id, ActorId`	Selects these Salesforce fields/aggregates: Id, ActorId. Query results are used in the surrounding assignment or loop.
99	`FROM ProcessInstanceWorkitem`	Chooses the Salesforce object/subquery source: FROM ProcessInstanceWorkitem.
100	`WHERE ProcessInstance.TargetObjectId = :orderId`	Adds a query/filter condition: WHERE ProcessInstance.TargetObjectId = :orderId. The complete condition determines which records are included.
101	`];`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
102	`System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.
103	`order.Officer__c,`	Continues the surrounding declaration/expression or text: order.Officer__c,. Read it with the preceding opening statement (System.assertEquals(); it is not a standalone business operation.
104	`work.ActorId,`	Continues the surrounding declaration/expression or text: work.ActorId,. Read it with the preceding opening statement (order.Officer__c,); it is not a standalone business operation.
105	`'Uses the assigned company officer, not the distributor.'`	Continues the surrounding declaration/expression or text: 'Uses the assigned company officer, not the distributor.'. Read it with the preceding opening statement (work.ActorId,); it is not a standalone business operation.
106	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
107	`System.assertEquals(orderId, call(cmd).get('id'));`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(orderId, call(cmd).get('id'));. A mismatch fails the test.

Line	Source code	Explanation / reading note
108	`cmd.notes = 'Changed payload';`	Assigns the right-hand expression to the named variable/property: cmd.notes = 'Changed payload';. This is in-memory unless it is later persisted by an explicit call.
109	`System.assert(call(cmd).containsKey('error'));`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'));. A mismatch fails the test.
110	`cmd.notes = null;`	Assigns the right-hand expression to the named variable/property: cmd.notes = null;. This is in-memory unless it is later persisted by an explicit call.
111	`Approval.ProcessWorkitemRequest decision = new Approval.ProcessWorkitemRequest();`	Calls the named method: Approval.ProcessWorkitemRequest decision = new Approval.ProcessWorkitemRequest();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
112	`decision.setWorkitemId(work.Id);`	Calls the named method: decision.setWorkitemId(work.Id);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
113	`decision.setAction('Approve');`	Calls the named method: decision.setAction('Approve');. Its implementation defines the side effect/result; use the symbol/file index to follow it.
114	`System.assert(Approval.process(decision).isSuccess());`	Test assertion comparing an expected outcome to actual behavior: System.assert(Approval.process(decision).isSuccess());. A mismatch fails the test.
115	`System.assertEquals('Approved', call(cmd).get('status'));`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals('Approved', call(cmd).get('status'));. A mismatch fails the test.
116	`System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.
117	`false,`	Continues the surrounding declaration/expression or text: false,. Read it with the preceding opening statement (System.assertEquals(); it is not a standalone business operation.
118	`Database.update(`	Performs Salesforce DML: Database.update(. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
119	`new DMS_Primary_Order__c(Id = orderId, Order_Source__c = 'Employee SFA'),`	Assigns the right-hand expression to the named variable/property: new DMS_Primary_Order__c(Id = orderId, Order_Source__c = 'Employee SFA'),. This is in-memory unless it is later persisted by an explicit call.
120	`false`	Continues the surrounding declaration/expression or text: false. Read it with the preceding opening statement (new DMS_Primary_Order__c(Id = orderId, Order_Source__c = 'Employee SFA'),); it is not a standalone business operation.

Line	Source code	Explanation / reading note
121	`)`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
122	`.isSuccess()`	Continues the surrounding declaration/expression or text: .isSuccess(). Read it with the preceding opening statement ( )); it is not a standalone business operation.
123	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
124	`Test.stopTest();`	Ends the Apex test window and runs queued test asynchronous work before checking outcomes.
125	`System.assertEquals(1, [SELECT COUNT() FROM DMS_Primary_Order__c]);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(1, [SELECT COUNT() FROM DMS_Primary_Order__c]);. A mismatch fails the test.
126	`System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.
127	`0,`	Continues the surrounding declaration/expression or text: 0,. Read it with the preceding opening statement (System.assertEquals(); it is not a standalone business operation.
128	`[SELECT COUNT() FROM DMS_Inventory__c],`	Continues the surrounding declaration/expression or text: [SELECT COUNT() FROM DMS_Inventory__c],. Read it with the preceding opening statement (0,); it is not a standalone business operation.
129	`'Approval is not a goods receipt.'`	Continues the surrounding declaration/expression or text: 'Approval is not a goods receipt.'. Read it with the preceding opening statement ([SELECT COUNT() FROM DMS_Inventory__c],); it is not a standalone business operation.
130	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
131	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
132	`@IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
133	`static void rejectsInvalidAndKeepsEmployeeIdentityRequired() {`	Continues the surrounding declaration/expression or text: static void rejectsInvalidAndKeepsEmployeeIdentityRequired() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.

Line	Source code	Explanation / reading note
134	`DmsPortalApi.Command cmd = fixture();`	Assigns the right-hand expression to the named variable/property: DmsPortalApi.Command cmd = fixture();. This is in-memory unless it is later persisted by an explicit call.
135	`cmd.lines[0].cases = 1;`	Assigns the right-hand expression to the named variable/property: cmd.lines[0].cases = 1;. This is in-memory unless it is later persisted by an explicit call.
136	`System.assert(call(cmd).containsKey('error'), 'Below scheme minimum');`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'), 'Below scheme minimum');. A mismatch fails the test.
137	`System.assertEquals(0, [SELECT COUNT() FROM DMS_Primary_Order__c]);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(0, [SELECT COUNT() FROM DMS_Primary_Order__c]);. A mismatch fails the test.
138	`System.assertEquals(0, [SELECT COUNT() FROM DMS_Primary_Order_Line__c]);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(0, [SELECT COUNT() FROM DMS_Primary_Order_Line__c]);. A mismatch fails the test.
139	`cmd.lines[0].cases = 2;`	Assigns the right-hand expression to the named variable/property: cmd.lines[0].cases = 2;. This is in-memory unless it is later persisted by an explicit call.
140	`cmd.action = 'primaryOrder';`	Assigns the right-hand expression to the named variable/property: cmd.action = 'primaryOrder';. This is in-memory unless it is later persisted by an explicit call.
141	`System.assert(call(cmd).containsKey('error'), 'SFA still requires an employee');`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'), 'SFA still requires an employee');. A mismatch fails the test.
142	`cmd.action = 'distributorPrimaryOrder';`	Assigns the right-hand expression to the named variable/property: cmd.action = 'distributorPrimaryOrder';. This is in-memory unless it is later persisted by an explicit call.
143	`Employee__c employee = new Employee__c(`	Assigns the right-hand expression to the named variable/property: Employee__c employee = new Employee__c(. This is in-memory unless it is later persisted by an explicit call.
144	`Name = 'Test employee',`	Assigns the right-hand expression to the named variable/property: Name = 'Test employee',. This is in-memory unless it is later persisted by an explicit call.
145	`Phone__c = '9000000000',`	Assigns the right-hand expression to the named variable/property: Phone__c = '9000000000',. This is in-memory unless it is later persisted by an explicit call.
146	`Active__c = true,`	Assigns the right-hand expression to the named variable/property: Active__c = true,. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
147	`            DMS_Distributor__c = cmd.distributorId`	Assigns the right-hand expression to the named variable/property: DMS_Distributor__c = cmd.distributorId. This is in-memory unless it is later persisted by an explicit call.
148	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
149	`        insert employee;`	Performs Salesforce DML: insert employee;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
150	`        cmd.employeeId = employee.Id;`	Assigns the right-hand expression to the named variable/property: cmd.employeeId = employee.Id;. This is in-memory unless it is later persisted by an explicit call.
151	`        System.assert(call(cmd).containsKey('error'), 'No impersonation');`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'), 'No impersonation');. A mismatch fails the test.
152	`        cmd.employeeId = null;`	Assigns the right-hand expression to the named variable/property: cmd.employeeId = null;. This is in-memory unless it is later persisted by an explicit call.
153	`        update new DMS_Distributor__c(Id = cmd.distributorId, Officer__c = null);`	Performs Salesforce DML: update new DMS_Distributor__c(Id = cmd.distributorId, Officer__c = null);. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
154	`        System.assert(call(cmd).containsKey('error'), 'No unassigned approvals');`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'), 'No unassigned approvals');. A mismatch fails the test.
155	`        System.assertEquals(0, [SELECT COUNT() FROM DMS_Primary_Order__c]);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(0, [SELECT COUNT() FROM DMS_Primary_Order__c]);. A mismatch fails the test.

force-app/main/default/classes/DmsOfficerSharing.cls-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

2 numbered source lines | SHA-256 0347267b36e4cd542616bb80997ae7c7634cf64ed063b5bd68dd2493c8fca3ea

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<ApexClass xmlns="http://soap.sforce.com/2006/04/metadata"><apiVersion>65.0</apiVersion><status>Active</status></ApexClass>`	Sets Apex Class in the enclosing configuration to <apiVersion>65.0</apiVersion><status>Active</status>.

force-app/main/default/classes/DmsPortalApi.cls

Current trusted-backend Apex REST boundary: permission gate, distributor lock, savepoint/rollback, primary commands, tickets, secondary decisions and atomic goods receipt/inventory posting.

309 numbered source lines | SHA-256 50874e4c111ce016615f10e952cb977e2621a998266df5130da98c17bcbb41dd

148	`WHERE Id = :cmd.recordId AND DMS_Distributor__c = : cmd.distributorId`	Adds a query/filter condition: WHERE Id = :cmd.recordId AND DMS_Distributor__c = :cmd.distributorId. The complete condition determines which records are included.
149	`FOR UPDATE`	Requests record locks for this query so concurrent commands cannot both use the same old state.
150	`]`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
151	`: (List<SObject>) [`	Continues the surrounding declaration/expression or text: : (List<SObject>) [. Read it with the preceding opening statement ( ]); it is not a standalone business operation.
152	`SELECT Id, DMS_Status__c`	Selects these Salesforce fields/aggregates: Id, DMS_Status__c. Query results are used in the surrounding assignment or loop.
153	`FROM Sales_Order__c`	Chooses the Salesforce object/subquery source: FROM Sales_Order__c.
154	`WHERE Id = :cmd.recordId AND DMS_Distributor__c = : cmd.distributorId`	Adds a query/filter condition: WHERE Id = :cmd.recordId AND DMS_Distributor__c = :cmd.distributorId. The complete condition determines which records are included.
155	`FOR UPDATE`	Requests record locks for this query so concurrent commands cannot both use the same old state.
156	`];`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
157	`if (rows.isEmpty())`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (rows.isEmpty()).
158	`throw new InputException('Record does not belong to this distributor.');`	Stops this execution path with a validation/error exception: throw new InputException('Record does not belong to this distributor.');. The caller/catch block decides how it is reported.
159	`SObject row = rows[0];`	Assigns the right-hand expression to the named variable/property: SObject row = rows[0];. This is in-memory unless it is later persisted by an explicit call.
160	`String status = (String) row.get('DMS_Status__c');`	Declares/initializes local data used by the surrounding operation: String status = (String) row.get('DMS_Status__c');. Collection contents and assignments below determine its purpose.

Line	Source code	Explanation / reading note
161	`        if (status == cmd.decision)`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (status == cmd.decision).
162	`            return result(row.Id, status);`	Returns result(row.Id, status) to the caller (or begins returned UI markup) and ends this execution path.
163	`        if (status != null && status != 'Pending')`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (status != null && status != 'Pending').
164	`            throw new InputException('This record was already decided. Refresh before continuing.');`	Stops this execution path with a validation/error exception: throw new InputException('This record was already decided. Refresh before continuing.');. The caller/catch block decides how it is reported.
165	`        row.put('DMS_Status__c', cmd.decision);`	Calls the named method: row.put('DMS_Status__c', cmd.decision);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
166	`        row.put('DMS_Decision_Notes__c', cmd.notes);`	Calls the named method: row.put('DMS_Decision_Notes__c', cmd.notes);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
167	`        if (!isReturn)`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!isReturn).
168	`            row.put('DMS_Decided_At__c', System.now());`	Calls the named method: row.put('DMS_Decided_At__c', System.now());. Its implementation defines the side effect/result; use the symbol/file index to follow it.
169	`        update row;`	Performs Salesforce DML: update row;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
170	`        return result(row.Id, cmd.decision);`	Returns result(row.Id, cmd.decision) to the caller (or begins returned UI markup) and ends this execution path.
171	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
172	`    private static Map<String, Object> receiveGoods(Command cmd) {`	Declares a callable function/method: private static Map<String, Object> receiveGoods(Command cmd) {. Parameters supply its inputs; the following block implements the operation.
173	`        if (cmd.receiptKind != null && !new Set<String>{ 'Paid', 'Free' }.contains(cmd.receiptKind))`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (cmd.receiptKind != null && !new Set<String>{ 'Paid', 'Free' }.contains(cmd.receiptKind)).

Line	Source code	Explanation / reading note
174	`throw new InputException('Choose Paid or Free goods.');`	Stops this execution path with a validation/error exception: throw new InputException('Choose Paid or Free goods.');. The caller/catch block decides how it is reported.
175	`Boolean freeGoods = cmd.receiptKind == 'Free';`	Declares/initializes local data used by the surrounding operation: Boolean freeGoods = cmd.receiptKind == 'Free';. Collection contents and assignments below determine its purpose.
176	`String requestKey = key(cmd);`	Declares/initializes local data used by the surrounding operation: String requestKey = key(cmd);. Collection contents and assignments below determine its purpose.
177	`List<DMS_Goods_Receipt__c> existing = [`	Declares/initializes local data used by the surrounding operation: List<DMS_Goods_Receipt__c> existing = [. Collection contents and assignments below determine its purpose.
178	`SELECT Id, Status__c`	Selects these Salesforce fields/aggregates: Id, Status__c. Query results are used in the surrounding assignment or loop.
179	`FROM DMS_Goods_Receipt__c`	Chooses the Salesforce object/subquery source: FROM DMS_Goods_Receipt__c.
180	`WHERE Request_Key__c = :requestKey`	Adds a query/filter condition: WHERE Request_Key__c = :requestKey. The complete condition determines which records are included.

294	`? 0`	Continues the surrounding declaration/expression or text: ? 0. Read it with the preceding opening statement (Case_Cost__c = freeGoods); it is not a standalone business operation.
295	`: (line.Case_Price__c -`	Continues the surrounding declaration/expression or text: : (line.Case_Price__c -. Read it with the preceding opening statement (? 0); it is not a standalone business operation.
296	`(line.Discount_Amount__c == null ? 0 : line.Discount_Amount__c) / line.Cases__c),`	Continues the surrounding declaration/expression or text: (line.Discount_Amount__c == null ? 0 : line.Discount_Amount__c) / line.Cases__c),. Read it with the preceding opening statement (: (line.Case_Price__c -); it is not a standalone business operation.
297	`Batch_Number__c = cmd.batch,`	Assigns the right-hand expression to the named variable/property: Batch_Number__c = cmd.batch,. This is in-memory unless it is later persisted by an explicit call.
298	`Expiry_Date__c = cmd.expiry`	Assigns the right-hand expression to the named variable/property: Expiry_Date__c = cmd.expiry. This is in-memory unless it is later persisted by an explicit call.
299	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
300	`stock.On_Hand_Pieces__c =`	Continues the surrounding declaration/expression or text: stock.On_Hand_Pieces__c =. Read it with the preceding opening statement ( );); it is not a standalone business operation.
301	`(stock.On_Hand_Pieces__c == null ? 0 : stock.On_Hand_Pieces__c) +`	Continues the surrounding declaration/expression or text: (stock.On_Hand_Pieces__c == null ? 0 : stock.On_Hand_Pieces__c) +. Read it with the preceding opening statement (stock.On_Hand_Pieces__c =); it is not a standalone business operation.
302	`cmd.cases * conversion;`	Continues the surrounding declaration/expression or text: cmd.cases * conversion;. Read it with the preceding opening statement ((stock.On_Hand_Pieces__c == null ? 0 : stock.On_Hand_Pieces__c) +); it is not a standalone business operation.

Line	Source code	Explanation / reading note
303	`stock.Last_Stock_Update__c = System.now();`	Calls the named method: stock.Last_Stock_Update__c = System.now();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
304	`upsert stock;`	Performs Salesforce DML: upsert stock;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
305	`receipt.Status__c = 'Received';`	Assigns the right-hand expression to the named variable/property: receipt.Status__c = 'Received';. This is in-memory unless it is later persisted by an explicit call.
306	`update receipt;`	Performs Salesforce DML: update receipt;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
307	`return result(receipt.Id, 'Received');`	Returns result(receipt.Id, 'Received') to the caller (or begins returned UI markup) and ends this execution path.
308	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
309	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

force-app/main/default/classes/DmsPortalApi.cls-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

2 numbered source lines | SHA-256 0347267b36e4cd542616bb80997ae7c7634cf64ed063b5bd68dd2493c8fca3ea

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<ApexClass xmlns="http://soap.sforce.com/2006/04/metadata"><apiVersion>65.0</apiVersion><status>Active</status></ApexClass>`	Sets Apex Class in the enclosing configuration to <apiVersion>65.0</apiVersion><status>Active</status>.

force-app/main/default/classes/DmsPortalApiTest.cls

Regression tests for DmsPortalApi. Fixture setup creates inputs, the action invokes behavior, and assertions compare actual results to expected outcomes. Tests with stubs do not verify the real mail provider or Salesforce transport.

531 numbered source lines | SHA-256 0a6e1589cf96043a3a7cf22c822e0949c040a796432c271a61fbd429f5167fe5

Line	Source code	Explanation / reading note
1	`@IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
2	`private class DmsPortalApiTest {`	Declares a class/type: private class DmsPortalApiTest {. Members below hold behavior and/or state.
3	`    @TestSetup`	Continues the surrounding declaration/expression or text: @TestSetup. Read it with the preceding opening statement (private class DmsPortalApiTest {); it is not a standalone business operation.
4	`    static void permission() {`	Continues the surrounding declaration/expression or text: static void permission() {. Read it with the preceding opening statement (@TestSetup); it is not a standalone business operation.
5	`        Id permissionId = [SELECT Id FROM PermissionSet WHERE Name = 'DMS_Backend_Transactions'].Id;`	Declares/initializes local data used by the surrounding operation: Id permissionId = [SELECT Id FROM PermissionSet WHERE Name = 'DMS_Backend_Transactions'].Id;. Collection contents and assignments below determine its purpose.
6	`        if (`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (.
7	`            [`	Continues the surrounding declaration/expression or text: [. Read it with the preceding opening statement (if (); it is not a standalone business operation.
8	`                SELECT COUNT()`	Selects these Salesforce fields/aggregates: COUNT(). Query results are used in the surrounding assignment or loop.
9	`                FROM PermissionSetAssignment`	Chooses the Salesforce object/subquery source: FROM PermissionSetAssignment.
10	`                WHERE AssigneeId = :UserInfo.getUserId() AND PermissionSetId = :permissionId`	Adds a query/filter condition: WHERE AssigneeId = :UserInfo.getUserId() AND PermissionSetId = :permissionId. The complete condition determines which records are included.

Line	Source code	Explanation / reading note
11	`            ] == 0`	Continues the surrounding declaration/expression or text:] == 0. Read it with the preceding opening statement (WHERE AssigneeId = :UserInfo.getUserId() AND PermissionSetId = :permissionId); it is not a standalone business operation.
12	`        )`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
13	`            insert new PermissionSetAssignment(`	Performs Salesforce DML: insert new PermissionSetAssignment(. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
14	`                AssigneeId = UserInfo.getUserId(),`	Calls the named method: AssigneeId = UserInfo.getUserId(),. Its implementation defines the side effect/result; use the symbol/file index to follow it.
15	`                PermissionSetId = permissionId`	Assigns the right-hand expression to the named variable/property: PermissionSetId = permissionId. This is in-memory unless it is later persisted by an explicit call.
16	`            );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
17	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
18	`    private static DMS_Distributor__c distributor() {`	Declares a callable function/method: private static DMS_Distributor__c distributor() {. Parameters supply its inputs; the following block implements the operation.
19	`        DMS_Distributor__c row = new DMS_Distributor__c(`	Assigns the right-hand expression to the named variable/property: DMS_Distributor__c row = new DMS_Distributor__c(. This is in-memory unless it is later persisted by an explicit call.
20	`            Name = 'Portal test',`	Assigns the right-hand expression to the named variable/property: Name = 'Portal test',. This is in-memory unless it is later persisted by an explicit call.
21	`            Active__c = true,`	Assigns the right-hand expression to the named variable/property: Active__c = true,. This is in-memory unless it is later persisted by an explicit call.
22	`            Officer__c = UserInfo.getUserId()`	Calls the named method: Officer__c = UserInfo.getUserId(). Its implementation defines the side effect/result; use the symbol/file index to follow it.
23	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
24	`        insert row;`	Performs Salesforce DML: insert row;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.

Line	Source code	Explanation / reading note
25	`        return row;`	Returns row to the caller (or begins returned UI markup) and ends this execution path.
26	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
27	`    private static Map<String, Object> call(DmsPortalApi.Command cmd) {`	Declares a callable function/method: private static Map<String, Object> call(DmsPortalApi.Command cmd) {. Parameters supply its inputs; the following block implements the operation.
28	`        RestContext.request = new RestRequest();`	Assigns the right-hand expression to the named variable/property: RestContext.request = new RestRequest();. This is in-memory unless it is later persisted by an explicit call.
29	`        RestContext.response = new RestResponse();`	Assigns the right-hand expression to the named variable/property: RestContext.response = new RestResponse();. This is in-memory unless it is later persisted by an explicit call.
30	`        RestContext.request.requestBody = Blob.valueOf(JSON.serialize(cmd));`	Converts structured data to JSON for HTTP, persistent storage or a fingerprint.
31	`        System.runAs(new User(Id = UserInfo.getUserId())) {`	Calls the named method: System.runAs(new User(Id = UserInfo.getUserId())) {. Its implementation defines the side effect/result; use the symbol/file index to follow it.
32	`            DmsPortalApi.execute();`	Calls the named method: DmsPortalApi.execute();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
33	`        }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
34	`        return (Map<String, Object>) JSON.deserializeUntyped(`	Converts JSON into structured data. Invalid JSON can throw; inspect validation and catch handling.
35	`            RestContext.response.responseBody.toString()`	Calls the named method: RestContext.response.responseBody.toString(). Its implementation defines the side effect/result; use the symbol/file index to follow it.
36	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
37	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
38	`    private static DmsPortalApi.Command ticket(Id distributorId) {`	Declares a callable function/method: private static DmsPortalApi.Command ticket(Id distributorId) {. Parameters supply its inputs; the following block implements the operation.
39	`        DmsPortalApi.Command cmd = new DmsPortalApi.Command();`	Calls the named method: DmsPortalApi.Command cmd = new DmsPortalApi.Command();. Its implementation defines the side effect/result; use the symbol/file index to follow it.

Line	Source code	Explanation / reading note
40	`cmd.action = 'ticket';`	Assigns the right-hand expression to the named variable/property: cmd.action = 'ticket';. This is in-memory unless it is later persisted by an explicit call.
41	`cmd.distributorId = distributorId;`	Assigns the right-hand expression to the named variable/property: cmd.distributorId = distributorId;. This is in-memory unless it is later persisted by an explicit call.
42	`cmd.requestKey = 'ticket-1234567890';`	Assigns the right-hand expression to the named variable/property: cmd.requestKey = 'ticket-1234567890';. This is in-memory unless it is later persisted by an explicit call.
43	`cmd.subject = 'Delivery issue';`	Assigns the right-hand expression to the named variable/property: cmd.subject = 'Delivery issue';. This is in-memory unless it is later persisted by an explicit call.
44	`cmd.category = 'Delivery';`	Assigns the right-hand expression to the named variable/property: cmd.category = 'Delivery';. This is in-memory unless it is later persisted by an explicit call.
45	`cmd.description = 'Shipment arrived late.';`	Assigns the right-hand expression to the named variable/property: cmd.description = 'Shipment arrived late.';. This is in-memory unless it is later persisted by an explicit call.
46	`return cmd;`	Returns cmd to the caller (or begins returned UI markup) and ends this execution path.
47	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
48	`@IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
49	`static void ticketLifecycleAndReplay() {`	Continues the surrounding declaration/expression or text: static void ticketLifecycleAndReplay() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.
50	`DmsPortalApi.Command cmd = ticket(distributor().Id);`	Assigns the right-hand expression to the named variable/property: DmsPortalApi.Command cmd = ticket(distributor().Id);. This is in-memory unless it is later persisted by an explicit call.
51	`Test.startTest();`	Starts the isolated Apex test execution window and resets the relevant governor-limit counters.
52	`Map<String, Object> created = call(cmd);`	Declares/initializes local data used by the surrounding operation: Map<String, Object> created = call(cmd);. Collection contents and assignments below determine its purpose.
53	`System.assertNotEquals(null, created.get('id'), JSON.serialize(created));`	Test assertion comparing an expected outcome to actual behavior: System.assertNotEquals(null, created.get('id'), JSON.serialize(created));. A mismatch fails the test.

Line	Source code	Explanation / reading note
54	`System.assertEquals(created.get('id'), call(cmd).get('id'));`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(created.get('id'), call(cmd).get('id'));. A mismatch fails the test.
55	`DMS_Support_Ticket__c row = [SELECT Id, Status__c, Officer__c FROM DMS_Support_Ticket__c];`	Assigns the right-hand expression to the named variable/property: DMS_Support_Ticket__c row = [SELECT Id, Status__c, Officer__c FROM DMS_Support_Ticket__c];. This is in-memory unless it is later persisted by an explicit call.
56	`System.assertEquals('Open', row.Status__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals('Open', row.Status__c);. A mismatch fails the test.
57	`System.assertEquals(UserInfo.getUserId(), row.Officer__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(UserInfo.getUserId(), row.Officer__c);. A mismatch fails the test.
58	`row.Status__c = 'Closed';`	Assigns the right-hand expression to the named variable/property: row.Status__c = 'Closed';. This is in-memory unless it is later persisted by an explicit call.
59	`System.assertEquals(false, Database.update(row, false).isSuccess());`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(false, Database.update(row, false).isSuccess());. A mismatch fails the test.
60	`row.Status__c = 'In Progress';`	Assigns the right-hand expression to the named variable/property: row.Status__c = 'In Progress';. This is in-memory unless it is later persisted by an explicit call.
61	`update row;`	Performs Salesforce DML: update row;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
62	`row.Status__c = 'Closed';`	Assigns the right-hand expression to the named variable/property: row.Status__c = 'Closed';. This is in-memory unless it is later persisted by an explicit call.
63	`System.assertEquals(false, Database.update(row, false).isSuccess());`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(false, Database.update(row, false).isSuccess());. A mismatch fails the test.
64	`row.Resolution__c = 'Replacement delivered';`	Assigns the right-hand expression to the named variable/property: row.Resolution__c = 'Replacement delivered';. This is in-memory unless it is later persisted by an explicit call.
65	`update row;`	Performs Salesforce DML: update row;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
66	`System.assertEquals('Closed', call(cmd).get('status'));`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals('Closed', call(cmd).get('status'));. A mismatch fails the test.

Line	Source code	Explanation / reading note
67	`cmd.subject = 'Changed';`	Assigns the right-hand expression to the named variable/property: cmd.subject = 'Changed';. This is in-memory unless it is later persisted by an explicit call.
68	`System.assert(call(cmd).containsKey('error'));`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'));. A mismatch fails the test.
69	`Test.stopTest();`	Ends the Apex test window and runs queued test asynchronous work before checking outcomes.
70	`System.assertEquals(1, [SELECT COUNT() FROM DMS_Support_Ticket__c]);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(1, [SELECT COUNT() FROM DMS_Support_Ticket__c]);. A mismatch fails the test.
71	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
72	`@IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
73	`static void badInputsAreAtomic() {`	Continues the surrounding declaration/expression or text: static void badInputsAreAtomic() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.
74	`DmsPortalApi.Command cmd = ticket(distributor().Id);`	Assigns the right-hand expression to the named variable/property: DmsPortalApi.Command cmd = ticket(distributor().Id);. This is in-memory unless it is later persisted by an explicit call.
75	`cmd.category = 'Invalid';`	Assigns the right-hand expression to the named variable/property: cmd.category = 'Invalid';. This is in-memory unless it is later persisted by an explicit call.
76	`System.assert(call(cmd).containsKey('error'));`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'));. A mismatch fails the test.
77	`cmd.category = 'Product';`	Assigns the right-hand expression to the named variable/property: cmd.category = 'Product';. This is in-memory unless it is later persisted by an explicit call.
78	`cmd.requestKey = 'bad';`	Assigns the right-hand expression to the named variable/property: cmd.requestKey = 'bad';. This is in-memory unless it is later persisted by an explicit call.
79	`System.assert(call(cmd).containsKey('error'));`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'));. A mismatch fails the test.
80	`cmd.action = 'unknown';`	Assigns the right-hand expression to the named variable/property: cmd.action = 'unknown';. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
81	`System.assert(call(cmd).containsKey('error'));`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'));. A mismatch fails the test.
82	`System.assertEquals(0, [SELECT COUNT() FROM DMS_Support_Ticket__c]);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(0, [SELECT COUNT() FROM DMS_Support_Ticket__c]);. A mismatch fails the test.
83	`cmd.action = 'secondaryDecision';`	Assigns the right-hand expression to the named variable/property: cmd.action = 'secondaryDecision';. This is in-memory unless it is later persisted by an explicit call.
84	`cmd.decision = 'Rejected';`	Assigns the right-hand expression to the named variable/property: cmd.decision = 'Rejected';. This is in-memory unless it is later persisted by an explicit call.
85	`cmd.notes = null;`	Assigns the right-hand expression to the named variable/property: cmd.notes = null;. This is in-memory unless it is later persisted by an explicit call.
86	`System.assert(call(cmd).containsKey('error'));`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'));. A mismatch fails the test.
87	`cmd.notes = 'Not needed';`	Assigns the right-hand expression to the named variable/property: cmd.notes = 'Not needed';. This is in-memory unless it is later persisted by an explicit call.
88	`System.assert(call(cmd).containsKey('error'));`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'));. A mismatch fails the test.
89	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
90	`@IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
91	`static void receivesApprovedGoodsOnceWithoutOverReceiving() {`	Continues the surrounding declaration/expression or text: static void receivesApprovedGoodsOnceWithoutOverReceiving() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.
92	`DMS_Distributor__c supplier = distributor();`	Assigns the right-hand expression to the named variable/property: DMS_Distributor__c supplier = distributor();. This is in-memory unless it is later persisted by an explicit call.
93	`Employee__c employee = new Employee__c(`	Assigns the right-hand expression to the named variable/property: Employee__c employee = new Employee__c(. This is in-memory unless it is later persisted by an explicit call.
94	`Name = 'Portal employee',`	Assigns the right-hand expression to the named variable/property: Name = 'Portal employee',. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
95	`Phone__c = '9000000000',`	Assigns the right-hand expression to the named variable/property: Phone__c = '9000000000',. This is in-memory unless it is later persisted by an explicit call.
96	`Active__c = true,`	Assigns the right-hand expression to the named variable/property: Active__c = true,. This is in-memory unless it is later persisted by an explicit call.
97	`DMS_Distributor__c = supplier.Id`	Assigns the right-hand expression to the named variable/property: DMS_Distributor__c = supplier.Id. This is in-memory unless it is later persisted by an explicit call.
98	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
99	`insert employee;`	Performs Salesforce DML: insert employee;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
100	`Product__c product = new Product__c(`	Assigns the right-hand expression to the named variable/property: Product__c product = new Product__c(. This is in-memory unless it is later persisted by an explicit call.
101	`Name = 'Portal product',`	Assigns the right-hand expression to the named variable/property: Name = 'Portal product',. This is in-memory unless it is later persisted by an explicit call.
102	`Product_Code__c = 'PORTAL-1',`	Assigns the right-hand expression to the named variable/property: Product_Code__c = 'PORTAL-1',. This is in-memory unless it is later persisted by an explicit call.
103	`MRP__c = 20,`	Assigns the right-hand expression to the named variable/property: MRP__c = 20,. This is in-memory unless it is later persisted by an explicit call.
104	`Retailer_Base_Price__c = 15,`	Assigns the right-hand expression to the named variable/property: Retailer_Base_Price__c = 15,. This is in-memory unless it is later persisted by an explicit call.
105	`Units_Per_Case__c = 10,`	Assigns the right-hand expression to the named variable/property: Units_Per_Case__c = 10,. This is in-memory unless it is later persisted by an explicit call.
106	`DMS_Case_Price__c = 100,`	Assigns the right-hand expression to the named variable/property: DMS_Case_Price__c = 100,. This is in-memory unless it is later persisted by an explicit call.
107	`Active__c = true,`	Assigns the right-hand expression to the named variable/property: Active__c = true,. This is in-memory unless it is later persisted by an explicit call.
108	`Sellable__c = true`	Assigns the right-hand expression to the named variable/property: Sellable__c = true. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
109	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
110	`insert product;`	Performs Salesforce DML: insert product;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
111	`DMS_Primary_Order__c order = new DMS_Primary_Order__c(`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Order__c order = new DMS_Primary_Order__c(. This is in-memory unless it is later persisted by an explicit call.
112	`Distributor__c = supplier.Id,`	Assigns the right-hand expression to the named variable/property: Distributor__c = supplier.Id,. This is in-memory unless it is later persisted by an explicit call.
113	`Employee__c = employee.Id`	Assigns the right-hand expression to the named variable/property: Employee__c = employee.Id. This is in-memory unless it is later persisted by an explicit call.
114	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

118	`Product__c = product.Id,`	Assigns the right-hand expression to the named variable/property: Product__c = product.Id,. This is in-memory unless it is later persisted by an explicit call.
119	`Cases__c = 3`	Assigns the right-hand expression to the named variable/property: Cases__c = 3. This is in-memory unless it is later persisted by an explicit call.
120	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
121	`insert line;`	Performs Salesforce DML: insert line;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.

Line	Source code	Explanation / reading note
122	`DmsPortalApi.Command cmd = new DmsPortalApi.Command();`	Calls the named method: DmsPortalApi.Command cmd = new DmsPortalApi.Command();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
123	`cmd.action = 'receiveGoods';`	Assigns the right-hand expression to the named variable/property: cmd.action = 'receiveGoods';. This is in-memory unless it is later persisted by an explicit call.
124	`cmd.distributorId = supplier.Id;`	Assigns the right-hand expression to the named variable/property: cmd.distributorId = supplier.Id;. This is in-memory unless it is later persisted by an explicit call.
125	`cmd.recordId = line.Id;`	Assigns the right-hand expression to the named variable/property: cmd.recordId = line.Id;. This is in-memory unless it is later persisted by an explicit call.
126	`cmd.cases = 2;`	Assigns the right-hand expression to the named variable/property: cmd.cases = 2;. This is in-memory unless it is later persisted by an explicit call.
127	`cmd.batch = 'BATCH-1';`	Assigns the right-hand expression to the named variable/property: cmd.batch = 'BATCH-1';. This is in-memory unless it is later persisted by an explicit call.
128	`cmd.expiry = Date.today().addDays(90);`	Calls the named method: cmd.expiry = Date.today().addDays(90);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
129	`cmd.requestKey = 'receipt-1234567890';`	Assigns the right-hand expression to the named variable/property: cmd.requestKey = 'receipt-1234567890';. This is in-memory unless it is later persisted by an explicit call.
130	`System.assert(call(cmd).containsKey('error'), 'Draft orders must not create stock.');`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'), 'Draft orders must not create stock.');. A mismatch fails the test.
131	`Approval.ProcessSubmitRequest submit = new Approval.ProcessSubmitRequest();`	Calls the named method: Approval.ProcessSubmitRequest submit = new Approval.ProcessSubmitRequest();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
132	`submit.setObjectId(order.Id);`	Calls the named method: submit.setObjectId(order.Id);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
133	`submit.setProcessDefinitionNameOrId('Company_Officer_Approval');`	Calls the named method: submit.setProcessDefinitionNameOrId('Company_Officer_Approval');. Its implementation defines the side effect/result; use the symbol/file index to follow it.
134	`Approval.ProcessResult submission = Approval.process(submit);`	Submits the configured Salesforce approval request. Inspect the returned result before claiming submission succeeded.

Line	Source code	Explanation / reading note
135	`Approval.ProcessWorkitemRequest approve = new Approval.ProcessWorkitemRequest();`	Calls the named method: Approval.ProcessWorkitemRequest approve = new Approval.ProcessWorkitemRequest();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
136	`approve.setWorkitemId(submission.getNewWorkitemIds()[0]);`	Calls the named method: approve.setWorkitemId(submission.getNewWorkitemIds()[0]);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
137	`approve.setAction('Approve');`	Calls the named method: approve.setAction('Approve');. Its implementation defines the side effect/result; use the symbol/file index to follow it.
138	`Approval.process(approve);`	Submits the configured Salesforce approval request. Inspect the returned result before claiming submission succeeded.
139	`Test.startTest();`	Starts the isolated Apex test execution window and resets the relevant governor-limit counters.
140	`Map<String, Object> receipt = call(cmd);`	Declares/initializes local data used by the surrounding operation: Map<String, Object> receipt = call(cmd);. Collection contents and assignments below determine its purpose.
141	`System.assertNotEquals(null, receipt.get('id'), JSON.serialize(receipt));`	Test assertion comparing an expected outcome to actual behavior: System.assertNotEquals(null, receipt.get('id'), JSON.serialize(receipt));. A mismatch fails the test.
142	`System.assertEquals(receipt.get('id'), call(cmd).get('id'));`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(receipt.get('id'), call(cmd).get('id'));. A mismatch fails the test.
143	`System.assertEquals(20, [SELECT On_Hand_Pieces__c FROM DMS_Inventory__c].On_Hand_Pieces__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(20, [SELECT On_Hand_Pieces__c FROM DMS_Inventory__c].On_Hand_Pieces__c);. A mismatch fails the test.
144	`cmd.cases = 1;`	Assigns the right-hand expression to the named variable/property: cmd.cases = 1;. This is in-memory unless it is later persisted by an explicit call.
145	`System.assert(call(cmd).containsKey('error'), 'Key reuse must not change payload.');`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'), 'Key reuse must not change payload.');. A mismatch fails the test.
146	`cmd.requestKey = 'receipt-abcdefghij';`	Assigns the right-hand expression to the named variable/property: cmd.requestKey = 'receipt-abcdefghij';. This is in-memory unless it is later persisted by an explicit call.
147	`cmd.cases = 2;`	Assigns the right-hand expression to the named variable/property: cmd.cases = 2;. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
148	`System.assert(call(cmd).containsKey('error'), 'No over receipt.');`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'), 'No over receipt.');. A mismatch fails the test.
149	`cmd.cases = 1;`	Assigns the right-hand expression to the named variable/property: cmd.cases = 1;. This is in-memory unless it is later persisted by an explicit call.
150	`System.assertNotEquals(null, call(cmd).get('id'));`	Test assertion comparing an expected outcome to actual behavior: System.assertNotEquals(null, call(cmd).get('id'));. A mismatch fails the test.
151	`Test.stopTest();`	Ends the Apex test window and runs queued test asynchronous work before checking outcomes.
152	`System.assertEquals(30, [SELECT On_Hand_Pieces__c FROM DMS_Inventory__c].On_Hand_Pieces__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(30, [SELECT On_Hand_Pieces__c FROM DMS_Inventory__c].On_Hand_Pieces__c);. A mismatch fails the test.
153	`System.assertEquals(2, [SELECT COUNT() FROM DMS_Goods_Receipt__c]);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(2, [SELECT COUNT() FROM DMS_Goods_Receipt__c]);. A mismatch fails the test.
154	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
155	`@IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
156	`static void returnDecisionIsScopedAndRepeatable() {`	Continues the surrounding declaration/expression or text: static void returnDecisionIsScopedAndRepeatable() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.
157	`DMS_Distributor__c supplier = distributor();`	Assigns the right-hand expression to the named variable/property: DMS_Distributor__c supplier = distributor();. This is in-memory unless it is later persisted by an explicit call.
158	`DMS_Distributor__c other = distributor();`	Assigns the right-hand expression to the named variable/property: DMS_Distributor__c other = distributor();. This is in-memory unless it is later persisted by an explicit call.
159	`Retailer__c outlet = new Retailer__c(`	Assigns the right-hand expression to the named variable/property: Retailer__c outlet = new Retailer__c(. This is in-memory unless it is later persisted by an explicit call.
160	`Name = 'Portal outlet',`	Assigns the right-hand expression to the named variable/property: Name = 'Portal outlet',. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
161	`            Active__c = true,`	Assigns the right-hand expression to the named variable/property: Active__c = true,. This is in-memory unless it is later persisted by an explicit call.
162	`            DMS_Distributor__c = supplier.Id`	Assigns the right-hand expression to the named variable/property: DMS_Distributor__c = supplier.Id. This is in-memory unless it is later persisted by an explicit call.
163	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
164	`        insert outlet;`	Performs Salesforce DML: insert outlet;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
165	`        Product__c product = new Product__c(`	Assigns the right-hand expression to the named variable/property: Product__c product = new Product__c(. This is in-memory unless it is later persisted by an explicit call.
166	`            Name = 'Return product',`	Assigns the right-hand expression to the named variable/property: Name = 'Return product',. This is in-memory unless it is later persisted by an explicit call.
167	`            Product_Code__c = 'PORTAL-R',`	Assigns the right-hand expression to the named variable/property: Product_Code__c = 'PORTAL-R',. This is in-memory unless it is later persisted by an explicit call.
168	`            MRP__c = 20,`	Assigns the right-hand expression to the named variable/property: MRP__c = 20,. This is in-memory unless it is later persisted by an explicit call.
169	`            Retailer_Base_Price__c = 15,`	Assigns the right-hand expression to the named variable/property: Retailer_Base_Price__c = 15,. This is in-memory unless it is later persisted by an explicit call.
170	`            Units_Per_Case__c = 10`	Assigns the right-hand expression to the named variable/property: Units_Per_Case__c = 10. This is in-memory unless it is later persisted by an explicit call.
171	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
172	`        insert product;`	Performs Salesforce DML: insert product;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
173	`        Product_Return__c returned = new Product_Return__c(`	Assigns the right-hand expression to the named variable/property: Product_Return__c returned = new Product_Return__c(. This is in-memory unless it is later persisted by an explicit call.
174	`            Outlet__c = outlet.Id,`	Assigns the right-hand expression to the named variable/property: Outlet__c = outlet.Id,. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
175	`Product__c = product.Id,`	Assigns the right-hand expression to the named variable/property: Product__c = product.Id,. This is in-memory unless it is later persisted by an explicit call.
176	`Quantity__c = 2,`	Assigns the right-hand expression to the named variable/property: Quantity__c = 2,. This is in-memory unless it is later persisted by an explicit call.
177	`Return_Reason__c = 'Damaged'`	Assigns the right-hand expression to the named variable/property: Return_Reason__c = 'Damaged'. This is in-memory unless it is later persisted by an explicit call.
178	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
179	`insert returned;`	Performs Salesforce DML: insert returned;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
180	`DmsPortalApi.Command cmd = new DmsPortalApi.Command();`	Calls the named method: DmsPortalApi.Command cmd = new DmsPortalApi.Command();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
181	`cmd.action = 'returnDecision';`	Assigns the right-hand expression to the named variable/property: cmd.action = 'returnDecision';. This is in-memory unless it is later persisted by an explicit call.
182	`cmd.recordId = returned.Id;`	Assigns the right-hand expression to the named variable/property: cmd.recordId = returned.Id;. This is in-memory unless it is later persisted by an explicit call.
183	`cmd.distributorId = other.Id;`	Assigns the right-hand expression to the named variable/property: cmd.distributorId = other.Id;. This is in-memory unless it is later persisted by an explicit call.
184	`cmd.decision = 'Approved';`	Assigns the right-hand expression to the named variable/property: cmd.decision = 'Approved';. This is in-memory unless it is later persisted by an explicit call.
185	`System.assert(call(cmd).containsKey('error'));`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'));. A mismatch fails the test.
186	`cmd.distributorId = supplier.Id;`	Assigns the right-hand expression to the named variable/property: cmd.distributorId = supplier.Id;. This is in-memory unless it is later persisted by an explicit call.
187	`System.assertEquals('Approved', call(cmd).get('status'));`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals('Approved', call(cmd).get('status'));. A mismatch fails the test.
188	`System.assertEquals('Approved', call(cmd).get('status'));`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals('Approved', call(cmd).get('status'));. A mismatch fails the test.

Line	Source code	Explanation / reading note
189	`        cmd.decision = 'Rejected';`	Assigns the right-hand expression to the named variable/property: cmd.decision = 'Rejected';. This is in-memory unless it is later persisted by an explicit call.
190	`        cmd.notes = 'Changed';`	Assigns the right-hand expression to the named variable/property: cmd.notes = 'Changed';. This is in-memory unless it is later persisted by an explicit call.
191	`        System.assert(call(cmd).containsKey('error'));`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'));. A mismatch fails the test.
192	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
193	`    @IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
194	`    static void employeeOrderUsesSalesforcePricesAndIsIdempotent() {`	Continues the surrounding declaration/expression or text: static void employeeOrderUsesSalesforcePricesAndIsIdempotent() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.
195	`        DMS_Distributor__c supplier = distributor();`	Assigns the right-hand expression to the named variable/property: DMS_Distributor__c supplier = distributor();. This is in-memory unless it is later persisted by an explicit call.
196	`        Employee__c employee = new Employee__c(`	Assigns the right-hand expression to the named variable/property: Employee__c employee = new Employee__c(. This is in-memory unless it is later persisted by an explicit call.
197	`            Name = 'Primary employee',`	Assigns the right-hand expression to the named variable/property: Name = 'Primary employee',. This is in-memory unless it is later persisted by an explicit call.
198	`            Phone__c = '9000000000',`	Assigns the right-hand expression to the named variable/property: Phone__c = '9000000000',. This is in-memory unless it is later persisted by an explicit call.
199	`            Active__c = true,`	Assigns the right-hand expression to the named variable/property: Active__c = true,. This is in-memory unless it is later persisted by an explicit call.
200	`            DMS_Distributor__c = supplier.Id`	Assigns the right-hand expression to the named variable/property: DMS_Distributor__c = supplier.Id. This is in-memory unless it is later persisted by an explicit call.
201	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
202	`        insert employee;`	Performs Salesforce DML: insert employee;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.

372	`Cases__c = 3,`	Assigns the right-hand expression to the named variable/property: Cases__c = 3,. This is in-memory unless it is later persisted by an explicit call.
373	`Scheme__c = scheme.Id`	Assigns the right-hand expression to the named variable/property: Scheme__c = scheme.Id. This is in-memory unless it is later persisted by an explicit call.
374	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
375	`insert line;`	Performs Salesforce DML: insert line;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
376	`line = [`	Assigns the right-hand expression to the named variable/property: line = [. This is in-memory unless it is later persisted by an explicit call.
377	`SELECT`	Selects these Salesforce fields/aggregates: SELECT. Query results are used in the surrounding assignment or loop.
378	`Id,`	Declares/initializes local data used by the surrounding operation: Id,. Collection contents and assignments below determine its purpose.
379	`Free_Cases__c,`	Continues the surrounding declaration/expression or text: Free_Cases__c,. Read it with the preceding opening statement (Id,); it is not a standalone business operation.

Line	Source code	Explanation / reading note
380	`Free_Product__c,`	Continues the surrounding declaration/expression or text: Free_Product__c,. Read it with the preceding opening statement (Free_Cases__c,); it is not a standalone business operation.
381	`Free_Pieces_Per_Case__c,`	Continues the surrounding declaration/expression or text: Free_Pieces_Per_Case__c,. Read it with the preceding opening statement (Free_Product__c,); it is not a standalone business operation.
382	`Discount_Amount__c,`	Continues the surrounding declaration/expression or text: Discount_Amount__c,. Read it with the preceding opening statement (Free_Pieces_Per_Case__c,); it is not a standalone business operation.
383	`Total_Pieces__c`	Continues the surrounding declaration/expression or text: Total_Pieces__c. Read it with the preceding opening statement (Discount_Amount__c,); it is not a standalone business operation.
384	`FROM DMS_Primary_Order_Line__c`	Chooses the Salesforce object/subquery source: FROM DMS_Primary_Order_Line__c.
385	`WHERE Id = :line.Id`	Adds a query/filter condition: WHERE Id = :line.Id. The complete condition determines which records are included.
386	`];`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
387	`System.assertEquals(6, line.Free_Cases__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(6, line.Free_Cases__c);. A mismatch fails the test.
388	`System.assertEquals(bonus.Id, line.Free_Product__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(bonus.Id, line.Free_Product__c);. A mismatch fails the test.
389	`System.assertEquals(20, line.Free_Pieces_Per_Case__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(20, line.Free_Pieces_Per_Case__c);. A mismatch fails the test.
390	`System.assertEquals(600, line.Discount_Amount__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(600, line.Discount_Amount__c);. A mismatch fails the test.
391	`System.assertEquals(150, line.Total_Pieces__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(150, line.Total_Pieces__c);. A mismatch fails the test.
392	`Approval.ProcessSubmitRequest submit = new Approval.ProcessSubmitRequest();`	Calls the named method: Approval.ProcessSubmitRequest submit = new Approval.ProcessSubmitRequest();. Its implementation defines the side effect/result; use the symbol/file index to follow it.

Line	Source code	Explanation / reading note
393	`submit.setObjectId(order.Id);`	Calls the named method: submit.setObjectId(order.Id);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
394	`submit.setProcessDefinitionNameOrId('Company_Officer_Approval');`	Calls the named method: submit.setProcessDefinitionNameOrId('Company_Officer_Approval');. Its implementation defines the side effect/result; use the symbol/file index to follow it.
395	`Approval.ProcessResult submission = Approval.process(submit);`	Submits the configured Salesforce approval request. Inspect the returned result before claiming submission succeeded.
396	`Approval.ProcessWorkitemRequest approve = new Approval.ProcessWorkitemRequest();`	Calls the named method: Approval.ProcessWorkitemRequest approve = new Approval.ProcessWorkitemRequest();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
397	`approve.setWorkitemId(submission.getNewWorkitemIds()[0]);`	Calls the named method: approve.setWorkitemId(submission.getNewWorkitemIds()[0]);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
398	`approve.setAction('Approve');`	Calls the named method: approve.setAction('Approve');. Its implementation defines the side effect/result; use the symbol/file index to follow it.
399	`Approval.process(approve);`	Submits the configured Salesforce approval request. Inspect the returned result before claiming submission succeeded.
400	`DmsPortalApi.Command cmd = new DmsPortalApi.Command();`	Calls the named method: DmsPortalApi.Command cmd = new DmsPortalApi.Command();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
401	`cmd.action = 'receiveGoods';`	Assigns the right-hand expression to the named variable/property: cmd.action = 'receiveGoods';. This is in-memory unless it is later persisted by an explicit call.
402	`cmd.distributorId = supplier.Id;`	Assigns the right-hand expression to the named variable/property: cmd.distributorId = supplier.Id;. This is in-memory unless it is later persisted by an explicit call.
403	`cmd.recordId = line.Id;`	Assigns the right-hand expression to the named variable/property: cmd.recordId = line.Id;. This is in-memory unless it is later persisted by an explicit call.
404	`cmd.receiptKind = 'Free';`	Assigns the right-hand expression to the named variable/property: cmd.receiptKind = 'Free';. This is in-memory unless it is later persisted by an explicit call.
405	`cmd.cases = 6;`	Assigns the right-hand expression to the named variable/property: cmd.cases = 6;. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
406	`cmd.batch = 'FREE1';`	Assigns the right-hand expression to the named variable/property: cmd.batch = 'FREE1';. This is in-memory unless it is later persisted by an explicit call.
407	`cmd.expiry = Date.today().addMonths(6);`	Calls the named method: cmd.expiry = Date.today().addMonths(6);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
408	`cmd.requestKey = 'free-receipt-123456';`	Assigns the right-hand expression to the named variable/property: cmd.requestKey = 'free-receipt-123456';. This is in-memory unless it is later persisted by an explicit call.
409	`Test.startTest();`	Starts the isolated Apex test execution window and resets the relevant governor-limit counters.
410	`Map<String, Object> result = call(cmd);`	Declares/initializes local data used by the surrounding operation: Map<String, Object> result = call(cmd);. Collection contents and assignments below determine its purpose.
411	`System.assertNotEquals(null, result.get('id'), JSON.serialize(result));`	Test assertion comparing an expected outcome to actual behavior: System.assertNotEquals(null, result.get('id'), JSON.serialize(result));. A mismatch fails the test.
412	`System.assertEquals(result.get('id'), call(cmd).get('id'));`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(result.get('id'), call(cmd).get('id'));. A mismatch fails the test.
413	`cmd.requestKey = 'free-receipt-654321';`	Assigns the right-hand expression to the named variable/property: cmd.requestKey = 'free-receipt-654321';. This is in-memory unless it is later persisted by an explicit call.
414	`cmd.cases = 1;`	Assigns the right-hand expression to the named variable/property: cmd.cases = 1;. This is in-memory unless it is later persisted by an explicit call.
415	`System.assert(call(cmd).containsKey('error'));`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(cmd).containsKey('error'));. A mismatch fails the test.
416	`Test.stopTest();`	Ends the Apex test window and runs queued test asynchronous work before checking outcomes.
417	`DMS_Inventory__c stock = [SELECT Product__c, On_Hand_Pieces__c FROM DMS_Inventory__c];`	Assigns the right-hand expression to the named variable/property: DMS_Inventory__c stock = [SELECT Product__c, On_Hand_Pieces__c FROM DMS_Inventory__c];. This is in-memory unless it is later persisted by an explicit call.
418	`System.assertEquals(bonus.Id, stock.Product__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(bonus.Id, stock.Product__c);. A mismatch fails the test.

Line	Source code	Explanation / reading note
419	`System.assertEquals(120, stock.On_Hand_Pieces__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(120, stock.On_Hand_Pieces__c);. A mismatch fails the test.
420	`System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.
421	`0,`	Continues the surrounding declaration/expression or text: 0,. Read it with the preceding opening statement (System.assertEquals(); it is not a standalone business operation.
422	`[SELECT Received_Value__c FROM DMS_Goods_Receipt_Line__c].Received_Value__c`	Continues the surrounding declaration/expression or text: [SELECT Received_Value__c FROM DMS_Goods_Receipt_Line__c].Received_Value__c. Read it with the preceding opening statement (0,); it is not a standalone business operation.
423	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
424	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
425	`@IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
426	`static void invalidSchemesAndSurveyOwnership() {`	Continues the surrounding declaration/expression or text: static void invalidSchemesAndSurveyOwnership() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.
427	`DMS_Distributor__c supplier = distributor();`	Assigns the right-hand expression to the named variable/property: DMS_Distributor__c supplier = distributor();. This is in-memory unless it is later persisted by an explicit call.
428	`Product__c product = new Product__c(`	Assigns the right-hand expression to the named variable/property: Product__c product = new Product__c(. This is in-memory unless it is later persisted by an explicit call.
429	`Name = 'Scheme check',`	Assigns the right-hand expression to the named variable/property: Name = 'Scheme check',. This is in-memory unless it is later persisted by an explicit call.
430	`Product_Code__c = 'SCHEME-CHECK',`	Assigns the right-hand expression to the named variable/property: Product_Code__c = 'SCHEME-CHECK',. This is in-memory unless it is later persisted by an explicit call.
431	`MRP__c = 20,`	Assigns the right-hand expression to the named variable/property: MRP__c = 20,. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
432	`Retailer_Base_Price__c = 15,`	Assigns the right-hand expression to the named variable/property: Retailer_Base_Price__c = 15,. This is in-memory unless it is later persisted by an explicit call.
433	`Units_Per_Case__c = 10,`	Assigns the right-hand expression to the named variable/property: Units_Per_Case__c = 10,. This is in-memory unless it is later persisted by an explicit call.
434	`DMS_Case_Price__c = 100,`	Assigns the right-hand expression to the named variable/property: DMS_Case_Price__c = 100,. This is in-memory unless it is later persisted by an explicit call.
435	`Active__c = true,`	Assigns the right-hand expression to the named variable/property: Active__c = true,. This is in-memory unless it is later persisted by an explicit call.
436	`Sellable__c = true`	Assigns the right-hand expression to the named variable/property: Sellable__c = true. This is in-memory unless it is later persisted by an explicit call.
437	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
438	`insert product;`	Performs Salesforce DML: insert product;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
439	`DMS_Primary_Order__c order = new DMS_Primary_Order__c(Distributor__c = supplier.Id);`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Order__c order = new DMS_Primary_Order__c(Distributor__c = supplier.Id);. This is in-memory unless it is later persisted by an explicit call.
440	`insert order;`	Performs Salesforce DML: insert order;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
441	`Scheme__c scheme = new Scheme__c(`	Assigns the right-hand expression to the named variable/property: Scheme__c scheme = new Scheme__c(. This is in-memory unless it is later persisted by an explicit call.
442	`Name = 'Minimum two',`	Assigns the right-hand expression to the named variable/property: Name = 'Minimum two',. This is in-memory unless it is later persisted by an explicit call.
443	`Scheme_Code__c = 'PRIMARY-MIN',`	Assigns the right-hand expression to the named variable/property: Scheme_Code__c = 'PRIMARY-MIN',. This is in-memory unless it is later persisted by an explicit call.
444	`Start_Date__c = Date.today().addDays(-30),`	Calls the named method: Start_Date__c = Date.today().addDays(-30),. Its implementation defines the side effect/result; use the symbol/file index to follow it.
445	`End_Date__c = Date.today().addDays(30),`	Calls the named method: End_Date__c = Date.today().addDays(30),. Its implementation defines the side effect/result; use the symbol/file index to follow it.

Line	Source code	Explanation / reading note
446	`Scheme_Type__c = 'Same Product Free',`	Assigns the right-hand expression to the named variable/property: Scheme_Type__c = 'Same Product Free',. This is in-memory unless it is later persisted by an explicit call.
447	`Sales_Channel__c = 'Primary',`	Assigns the right-hand expression to the named variable/property: Sales_Channel__c = 'Primary',. This is in-memory unless it is later persisted by an explicit call.
448	`Product__c = product.Id,`	Assigns the right-hand expression to the named variable/property: Product__c = product.Id,. This is in-memory unless it is later persisted by an explicit call.
449	`Active__c = true,`	Assigns the right-hand expression to the named variable/property: Active__c = true,. This is in-memory unless it is later persisted by an explicit call.
450	`Minimum_Cases__c = 2,`	Assigns the right-hand expression to the named variable/property: Minimum_Cases__c = 2,. This is in-memory unless it is later persisted by an explicit call.
451	`Free_Cases__c = 1,`	Assigns the right-hand expression to the named variable/property: Free_Cases__c = 1,. This is in-memory unless it is later persisted by an explicit call.
452	`Discount_Amount__c = 5,`	Assigns the right-hand expression to the named variable/property: Discount_Amount__c = 5,. This is in-memory unless it is later persisted by an explicit call.
453	`Free_Gift__c = 'Display',`	Assigns the right-hand expression to the named variable/property: Free_Gift__c = 'Display',. This is in-memory unless it is later persisted by an explicit call.
454	`Gift_Quantity__c = 1`	Assigns the right-hand expression to the named variable/property: Gift_Quantity__c = 1. This is in-memory unless it is later persisted by an explicit call.
455	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
456	`insert scheme;`	Performs Salesforce DML: insert scheme;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
457	`DMS_Primary_Order_Line__c line = new DMS_Primary_Order_Line__c(`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Order_Line__c line = new DMS_Primary_Order_Line__c(. This is in-memory unless it is later persisted by an explicit call.
458	`Order__c = order.Id,`	Assigns the right-hand expression to the named variable/property: Order__c = order.Id,. This is in-memory unless it is later persisted by an explicit call.
459	`Product__c = product.Id,`	Assigns the right-hand expression to the named variable/property: Product__c = product.Id,. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
460	`Cases__c = 1,`	Assigns the right-hand expression to the named variable/property: Cases__c = 1,. This is in-memory unless it is later persisted by an explicit call.
461	`Scheme__c = scheme.Id`	Assigns the right-hand expression to the named variable/property: Scheme__c = scheme.Id. This is in-memory unless it is later persisted by an explicit call.
462	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
463	`System.assertEquals(false, Database.insert(line, false).isSuccess());`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(false, Database.insert(line, false).isSuccess());. A mismatch fails the test.
464	`line.Cases__c = 5;`	Assigns the right-hand expression to the named variable/property: line.Cases__c = 5;. This is in-memory unless it is later persisted by an explicit call.
465	`insert line;`	Performs Salesforce DML: insert line;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
466	`line = [`	Assigns the right-hand expression to the named variable/property: line = [. This is in-memory unless it is later persisted by an explicit call.
467	`SELECT Id, Free_Cases__c, Gift_Quantity__c, Discount_Amount__c, Scheme__c`	Selects these Salesforce fields/aggregates: Id, Free_Cases__c, Gift_Quantity__c, Discount_Amount__c, Scheme__c. Query results are used in the surrounding assignment or loop.
468	`FROM DMS_Primary_Order_Line__c`	Chooses the Salesforce object/subquery source: FROM DMS_Primary_Order_Line__c.
469	`WHERE Id = :line.Id`	Adds a query/filter condition: WHERE Id = :line.Id. The complete condition determines which records are included.
470	`];`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
471	`System.assertEquals(2, line.Free_Cases__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(2, line.Free_Cases__c);. A mismatch fails the test.
472	`System.assertEquals(10, line.Discount_Amount__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(10, line.Discount_Amount__c);. A mismatch fails the test.
473	`System.assertEquals(2, line.Gift_Quantity__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(2, line.Gift_Quantity__c);. A mismatch fails the test.

Line	Source code	Explanation / reading note
474	`line.Scheme__c = null;`	Assigns the right-hand expression to the named variable/property: line.Scheme__c = null;. This is in-memory unless it is later persisted by an explicit call.
475	`update line;`	Performs Salesforce DML: update line;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
476	`System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.
477	`0,`	Continues the surrounding declaration/expression or text: 0,. Read it with the preceding opening statement (System.assertEquals(); it is not a standalone business operation.
478	`[SELECT Free_Cases__c FROM DMS_Primary_Order_Line__c WHERE Id = :line.Id].Free_Cases__c`	Assigns the right-hand expression to the named variable/property: [SELECT Free_Cases__c FROM DMS_Primary_Order_Line__c WHERE Id = :line.Id].Free_Cases__c. This is in-memory unless it is later persisted by an explicit call.
479	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
480	`scheme.Active__c = false;`	Assigns the right-hand expression to the named variable/property: scheme.Active__c = false;. This is in-memory unless it is later persisted by an explicit call.
481	`update scheme;`	Performs Salesforce DML: update scheme;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
482	`line.Scheme__c = scheme.Id;`	Assigns the right-hand expression to the named variable/property: line.Scheme__c = scheme.Id;. This is in-memory unless it is later persisted by an explicit call.
483	`System.assertEquals(false, Database.update(line, false).isSuccess());`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(false, Database.update(line, false).isSuccess());. A mismatch fails the test.
484	`scheme.Active__c = true;`	Assigns the right-hand expression to the named variable/property: scheme.Active__c = true;. This is in-memory unless it is later persisted by an explicit call.
485	`scheme.End_Date__c = Date.today().addDays(-1);`	Calls the named method: scheme.End_Date__c = Date.today().addDays(-1);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
486	`update scheme;`	Performs Salesforce DML: update scheme;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.

Line	Source code	Explanation / reading note
487	`System.assertEquals(false, Database.update(line, false).isSuccess());`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(false, Database.update(line, false).isSuccess());. A mismatch fails the test.
488	`scheme.End_Date__c = Date.today().addDays(30);`	Calls the named method: scheme.End_Date__c = Date.today().addDays(30);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
489	`scheme.Discount_Percent__c = 100;`	Assigns the right-hand expression to the named variable/property: scheme.Discount_Percent__c = 100;. This is in-memory unless it is later persisted by an explicit call.
490	`scheme.Discount_Amount__c = 50;`	Assigns the right-hand expression to the named variable/property: scheme.Discount_Amount__c = 50;. This is in-memory unless it is later persisted by an explicit call.
491	`update scheme;`	Performs Salesforce DML: update scheme;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
492	`System.assertEquals(false, Database.update(line, false).isSuccess());`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(false, Database.update(line, false).isSuccess());. A mismatch fails the test.
493	`DMS_Distributor_Survey__c survey = new DMS_Distributor_Survey__c(`	Assigns the right-hand expression to the named variable/property: DMS_Distributor_Survey__c survey = new DMS_Distributor_Survey__c(. This is in-memory unless it is later persisted by an explicit call.
494	`Distributor__c = supplier.Id,`	Assigns the right-hand expression to the named variable/property: Distributor__c = supplier.Id,. This is in-memory unless it is later persisted by an explicit call.
495	`Product__c = product.Id,`	Assigns the right-hand expression to the named variable/property: Product__c = product.Id,. This is in-memory unless it is later persisted by an explicit call.
496	`Visit_Date__c = Date.today(),`	Calls the named method: Visit_Date__c = Date.today(),. Its implementation defines the side effect/result; use the symbol/file index to follow it.
497	`Stock_Cases__c = 5,`	Assigns the right-hand expression to the named variable/property: Stock_Cases__c = 5,. This is in-memory unless it is later persisted by an explicit call.
498	`Movement__c = 'Slow Moving',`	Assigns the right-hand expression to the named variable/property: Movement__c = 'Slow Moving',. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
499	`Demand_Notes__c = 'Review demand next month.'`	Assigns the right-hand expression to the named variable/property: Demand_Notes__c = 'Review demand next month.'. This is in-memory unless it is later persisted by an explicit call.
500	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
501	`insert survey;`	Performs Salesforce DML: insert survey;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
502	`System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.
503	`UserInfo.getUserId(),`	Calls the named method: UserInfo.getUserId(),. Its implementation defines the side effect/result; use the symbol/file index to follow it.
504	`[SELECT Officer__c FROM DMS_Distributor_Survey__c WHERE Id = :survey.Id].Officer__c`	Assigns the right-hand expression to the named variable/property: [SELECT Officer__c FROM DMS_Distributor_Survey__c WHERE Id = :survey.Id].Officer__c. This is in-memory unless it is later persisted by an explicit call.
505	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
506	`supplier.Officer__c = null;`	Assigns the right-hand expression to the named variable/property: supplier.Officer__c = null;. This is in-memory unless it is later persisted by an explicit call.
507	`update supplier;`	Performs Salesforce DML: update supplier;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
508	`survey.Stock_Cases__c = 6;`	Assigns the right-hand expression to the named variable/property: survey.Stock_Cases__c = 6;. This is in-memory unless it is later persisted by an explicit call.
509	`System.assertEquals(false, Database.update(survey, false).isSuccess());`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(false, Database.update(survey, false).isSuccess());. A mismatch fails the test.
510	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
511	`@IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.

Line	Source code	Explanation / reading note
512	`    static void deniesUntrustedUser() {`	Continues the surrounding declaration/expression or text: static void deniesUntrustedUser() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.
513	`        User user = new User(`	Assigns the right-hand expression to the named variable/property: User user = new User(. This is in-memory unless it is later persisted by an explicit call.
514	`            Alias = 'notrust',`	Assigns the right-hand expression to the named variable/property: Alias = 'notrust',. This is in-memory unless it is later persisted by an explicit call.
515	`            Email = 'no@example.invalid',`	Assigns the right-hand expression to the named variable/property: Email = 'no@example.invalid',. This is in-memory unless it is later persisted by an explicit call.
516	`            EmailEncodingKey = 'UTF-8',`	Assigns the right-hand expression to the named variable/property: EmailEncodingKey = 'UTF-8',. This is in-memory unless it is later persisted by an explicit call.
517	`            LastName = 'No API Access',`	Assigns the right-hand expression to the named variable/property: LastName = 'No API Access',. This is in-memory unless it is later persisted by an explicit call.
518	`            LanguageLocaleKey = 'en_US',`	Assigns the right-hand expression to the named variable/property: LanguageLocaleKey = 'en_US',. This is in-memory unless it is later persisted by an explicit call.
519	`            LocaleSidKey = 'en_US',`	Assigns the right-hand expression to the named variable/property: LocaleSidKey = 'en_US',. This is in-memory unless it is later persisted by an explicit call.
520	`            TimeZoneSidKey = 'Asia/Kolkata',`	Assigns the right-hand expression to the named variable/property: TimeZoneSidKey = 'Asia/Kolkata',. This is in-memory unless it is later persisted by an explicit call.
521	`            ProfileId = [SELECT Id FROM Profile WHERE Name = 'Standard Platform User' LIMIT 1]`	Assigns the right-hand expression to the named variable/property: ProfileId = [SELECT Id FROM Profile WHERE Name = 'Standard Platform User' LIMIT 1]. This is in-memory unless it is later persisted by an explicit call.
522	`            .Id,`	Continues the surrounding declaration/expression or text: .Id,. Read it with the preceding opening statement (ProfileId = [SELECT Id FROM Profile WHERE Name = 'Standard Platform User' LIMIT 1]); it is not a standalone business operation.
523	`            Username = 'no-dms-' + System.now().getTime() + '@example.invalid'`	Calls the named method: Username = 'no-dms-' + System.now().getTime() + '@example.invalid'. Its implementation defines the side effect/result; use the symbol/file index to follow it.
524	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

Line	Source code	Explanation / reading note
525	`insert user;`	Performs Salesforce DML: insert user;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
526	`System.runAs(user) {`	Calls the named method: System.runAs(user) {. Its implementation defines the side effect/result; use the symbol/file index to follow it.
527	`System.assert(call(new DmsPortalApi.Command()).containsKey('error'));`	Test assertion comparing an expected outcome to actual behavior: System.assert(call(new DmsPortalApi.Command()).containsKey('error'));. A mismatch fails the test.
528	`System.assertEquals(403, RestContext.response.statusCode);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(403, RestContext.response.statusCode);. A mismatch fails the test.
529	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
530	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
531	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

force-app/main/default/classes/DmsPortalApiTest.cls-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

2 numbered source lines | SHA-256 0347267b36e4cd542616bb80997ae7c7634cf64ed063b5bd68dd2493c8fca3ea

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<ApexClass xmlns="http://soap.sforce.com/2006/04/metadata"><apiVersion>65.0</apiVersion><status>Active</status></ApexClass>`	Sets Apex Class in the enclosing configuration to <apiVersion>65.0</apiVersion><status>Active</status>.

force-app/main/default/classes/DmsPrimarySchemes.cls

Server-owned Primary scheme eligibility and benefit calculation. Applies whole-case minimums, buy-block repetition, discounts, free product conversion and gifts.

140 numbered source lines | SHA-256 8d4cf70ae50b7cac191201191330ee4dd0612307d8ed3f0eaa0417b36cee4a1f

56	`.Id`	Continues the surrounding declaration/expression or text: .Id. Read it with the preceding opening statement (Employee__c = [SELECT Id FROM Employee__c LIMIT 1]); it is not a standalone business operation.
57	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
58	`insert record;`	Performs Salesforce DML: insert record;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
59	`insert new DMS_Primary_Return_Line__c(`	Performs Salesforce DML: insert new DMS_Primary_Return_Line__c(. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
60	`Primary_Return__c = record.Id,`	Assigns the right-hand expression to the named variable/property: Primary_Return__c = record.Id,. This is in-memory unless it is later persisted by an explicit call.
61	`Product__c = [SELECT Id FROM Product__c LIMIT 1]`	Assigns the right-hand expression to the named variable/property: Product__c = [SELECT Id FROM Product__c LIMIT 1]. This is in-memory unless it is later persisted by an explicit call.
62	`.Id,`	Continues the surrounding declaration/expression or text: .Id,. Read it with the preceding opening statement (Product__c = [SELECT Id FROM Product__c LIMIT 1]); it is not a standalone business operation.
63	`Cases__c = 1,`	Assigns the right-hand expression to the named variable/property: Cases__c = 1,. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
64	`            Reason__c = 'Damaged'`	Assigns the right-hand expression to the named variable/property: Reason__c = 'Damaged'. This is in-memory unless it is later persisted by an explicit call.
65	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
66	`        return record;`	Returns record to the caller (or begins returned UI markup) and ends this execution path.
67	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
68	`    private static Approval.ProcessResult submit(Id recordId, String process) {`	Declares a callable function/method: private static Approval.ProcessResult submit(Id recordId, String process) {. Parameters supply its inputs; the following block implements the operation.
69	`        Approval.ProcessSubmitRequest request = new Approval.ProcessSubmitRequest();`	Calls the named method: Approval.ProcessSubmitRequest request = new Approval.ProcessSubmitRequest();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
70	`        request.setObjectId(recordId);`	Calls the named method: request.setObjectId(recordId);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
71	`        request.setProcessDefinitionNameOrId(process);`	Calls the named method: request.setProcessDefinitionNameOrId(process);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
72	`        Approval.ProcessResult result = Approval.process(request);`	Submits the configured Salesforce approval request. Inspect the returned result before claiming submission succeeded.
73	`        System.assert(result.isSuccess(), 'Approval submission must succeed.');`	Test assertion comparing an expected outcome to actual behavior: System.assert(result.isSuccess(), 'Approval submission must succeed.');. A mismatch fails the test.
74	`        System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.
75	`            UserInfo.getUserId(),`	Calls the named method: UserInfo.getUserId(),. Its implementation defines the side effect/result; use the symbol/file index to follow it.
76	`            [SELECT ActorId FROM ProcessInstanceWorkitem WHERE Id = : result.getNewWorkitemIds()[0]]`	Calls the named method: [SELECT ActorId FROM ProcessInstanceWorkitem WHERE Id = :result.getNewWorkitemIds()[0]]. Its implementation defines the side effect/result; use the symbol/file index to follow it.

Line	Source code	Explanation / reading note
77	`.ActorId,`	Continues the surrounding declaration/expression or text: .ActorId,. Read it with the preceding opening statement ([SELECT ActorId FROM ProcessInstanceWorkitem WHERE Id = :result.getNewWorkitemIds()[0]]); it is not a standalone business operation.
78	`'Route to the distributor company officer.'`	Continues the surrounding declaration/expression or text: 'Route to the distributor company officer.'. Read it with the preceding opening statement (.ActorId,); it is not a standalone business operation.
79	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
80	`return result;`	Returns result to the caller (or begins returned UI markup) and ends this execution path.
81	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
82	`private static void decide(Approval.ProcessResult submitted, String action) {`	Declares a callable function/method: private static void decide(Approval.ProcessResult submitted, String action) {. Parameters supply its inputs; the following block implements the operation.
83	`Approval.ProcessWorkitemRequest request = new Approval.ProcessWorkitemRequest();`	Calls the named method: Approval.ProcessWorkitemRequest request = new Approval.ProcessWorkitemRequest();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
84	`request.setWorkitemId(submitted.getNewWorkitemIds()[0]);`	Calls the named method: request.setWorkitemId(submitted.getNewWorkitemIds()[0]);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
85	`request.setAction(action);`	Calls the named method: request.setAction(action);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
86	`request.setComments('Workflow verification decision');`	Calls the named method: request.setComments('Workflow verification decision');. Its implementation defines the side effect/result; use the symbol/file index to follow it.
87	`System.assert(Approval.process(request).isSuccess());`	Test assertion comparing an expected outcome to actual behavior: System.assert(Approval.process(request).isSuccess());. A mismatch fails the test.
88	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
89	`@IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.

Line	Source code	Explanation / reading note
90	`    static void snapshotsAndRecalculatesDiscountedTotals() {`	Continues the surrounding declaration/expression or text: static void snapshotsAndRecalculatesDiscountedTotals() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.
91	`        DMS_Primary_Order__c parent = order();`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Order__c parent = order();. This is in-memory unless it is later persisted by an explicit call.
92	`        DMS_Primary_Order_Line__c line = orderLine(parent.Id);`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Order_Line__c line = orderLine(parent.Id);. This is in-memory unless it is later persisted by an explicit call.
93	`        DMS_Primary_Order_Line__c saved = [`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Order_Line__c saved = [. This is in-memory unless it is later persisted by an explicit call.
94	`            SELECT Pieces_Per_Case__c, Case_Price__c, Tax_Percent__c, Total_Pieces__c`	Selects these Salesforce fields/aggregates: Pieces_Per_Case__c, Case_Price__c, Tax_Percent__c, Total_Pieces__c. Query results are used in the surrounding assignment or loop.
95	`            FROM DMS_Primary_Order_Line__c`	Chooses the Salesforce object/subquery source: FROM DMS_Primary_Order_Line__c.
96	`            WHERE Id = :line.Id`	Adds a query/filter condition: WHERE Id = :line.Id. The complete condition determines which records are included.
97	`        ];`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
98	`        System.assertEquals(20, saved.Pieces_Per_Case__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(20, saved.Pieces_Per_Case__c);. A mismatch fails the test.
99	`        System.assertEquals(100, saved.Case_Price__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(100, saved.Case_Price__c);. A mismatch fails the test.
100	`        System.assertEquals(5, saved.Tax_Percent__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(5, saved.Tax_Percent__c);. A mismatch fails the test.
101	`        System.assertEquals(60, saved.Total_Pieces__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(60, saved.Total_Pieces__c);. A mismatch fails the test.
102	`        System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.

Line	Source code	Explanation / reading note
103	`            199.50,`	Continues the surrounding declaration/expression or text: 199.50,. Read it with the preceding opening statement (System.assertEquals(); it is not a standalone business operation.
104	`            [SELECT Total_Amount__c FROM DMS_Primary_Order__c WHERE Id = :parent.Id].Total_Amount__c`	Assigns the right-hand expression to the named variable/property: [SELECT Total_Amount__c FROM DMS_Primary_Order__c WHERE Id = :parent.Id].Total_Amount__c. This is in-memory unless it is later persisted by an explicit call.
105	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
106	`        Product__c product = [SELECT Id FROM Product__c LIMIT 1];`	Assigns the right-hand expression to the named variable/property: Product__c product = [SELECT Id FROM Product__c LIMIT 1];. This is in-memory unless it is later persisted by an explicit call.
107	`        product.DMS_Case_Price__c = 200;`	Assigns the right-hand expression to the named variable/property: product.DMS_Case_Price__c = 200;. This is in-memory unless it is later persisted by an explicit call.
108	`        product.Units_Per_Case__c = 30;`	Assigns the right-hand expression to the named variable/property: product.Units_Per_Case__c = 30;. This is in-memory unless it is later persisted by an explicit call.
109	`        update product;`	Performs Salesforce DML: update product;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
110	`        update new DMS_Primary_Order_Line__c(Id = line.Id, Cases__c = 3);`	Performs Salesforce DML: update new DMS_Primary_Order_Line__c(Id = line.Id, Cases__c = 3);. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
111	`        System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.

179	`            [SELECT Status__c FROM DMS_Primary_Return__c WHERE Id = :rejected.Id].Status__c`	Assigns the right-hand expression to the named variable/property: [SELECT Status__c FROM DMS_Primary_Return__c WHERE Id = :rejected.Id].Status__c. This is in-memory unless it is later persisted by an explicit call.
180	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
181	`        System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.
182	`            100,`	Continues the surrounding declaration/expression or text: 100,. Read it with the preceding opening statement (System.assertEquals(); it is not a standalone business operation.
183	`            [SELECT Total_Amount__c FROM DMS_Primary_Return__c WHERE Id = :approved.Id]`	Assigns the right-hand expression to the named variable/property: [SELECT Total_Amount__c FROM DMS_Primary_Return__c WHERE Id = :approved.Id]. This is in-memory unless it is later persisted by an explicit call.
184	`            .Total_Amount__c`	Continues the surrounding declaration/expression or text: .Total_Amount__c. Read it with the preceding opening statement ([SELECT Total_Amount__c FROM DMS_Primary_Return__c WHERE Id = :approved.Id]); it is not a standalone business operation.
185	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
186	`        DMS_Primary_Return_Line__c line = [`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Return_Line__c line = [. This is in-memory unless it is later persisted by an explicit call.
187	`            SELECT Id`	Selects these Salesforce fields/aggregates: Id. Query results are used in the surrounding assignment or loop.
188	`            FROM DMS_Primary_Return_Line__c`	Chooses the Salesforce object/subquery source: FROM DMS_Primary_Return_Line__c.

Line	Source code	Explanation / reading note
189	`            WHERE Primary_Return__c = :approved.Id`	Adds a query/filter condition: WHERE Primary_Return__c = :approved.Id. The complete condition determines which records are included.
190	`        ];`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
191	`        System.assertEquals(false, Database.delete(line, false).isSuccess());`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(false, Database.delete(line, false).isSuccess());. A mismatch fails the test.
192	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
193	`    @IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
194	`    static void preventsEmptyOrMismatchedSubmission() {`	Continues the surrounding declaration/expression or text: static void preventsEmptyOrMismatchedSubmission() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.
195	`        DMS_Primary_Order__c empty = order();`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Order__c empty = order();. This is in-memory unless it is later persisted by an explicit call.
196	`        Approval.ProcessSubmitRequest emptyRequest = new Approval.ProcessSubmitRequest();`	Calls the named method: Approval.ProcessSubmitRequest emptyRequest = new Approval.ProcessSubmitRequest();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
197	`        emptyRequest.setObjectId(empty.Id);`	Calls the named method: emptyRequest.setObjectId(empty.Id);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
198	`        emptyRequest.setProcessDefinitionNameOrId('Company_Officer_Approval');`	Calls the named method: emptyRequest.setProcessDefinitionNameOrId('Company_Officer_Approval');. Its implementation defines the side effect/result; use the symbol/file index to follow it.
199	`        System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.
200	`            false,`	Continues the surrounding declaration/expression or text: false,. Read it with the preceding opening statement (System.assertEquals(); it is not a standalone business operation.
201	`            Approval.process(emptyRequest, false).isSuccess(),`	Submits the configured Salesforce approval request. Inspect the returned result before claiming submission succeeded.

Line	Source code	Explanation / reading note
202	`'Actual approval submission must reject orders without products.'`	Continues the surrounding declaration/expression or text: 'Actual approval submission must reject orders without products.'. Read it with the preceding opening statement (Approval.process(emptyRequest, false).isSuccess(),); it is not a standalone business operation.
203	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
204	`empty.Status__c = 'Submitted';`	Assigns the right-hand expression to the named variable/property: empty.Status__c = 'Submitted';. This is in-memory unless it is later persisted by an explicit call.
205	`System.assertEquals(false, Database.update(empty, false).isSuccess());`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(false, Database.update(empty, false).isSuccess());. A mismatch fails the test.
206	`DMS_Distributor__c other = new DMS_Distributor__c(`	Assigns the right-hand expression to the named variable/property: DMS_Distributor__c other = new DMS_Distributor__c(. This is in-memory unless it is later persisted by an explicit call.
207	`Name = 'Other distributor',`	Assigns the right-hand expression to the named variable/property: Name = 'Other distributor',. This is in-memory unless it is later persisted by an explicit call.
208	`Active__c = true`	Assigns the right-hand expression to the named variable/property: Active__c = true. This is in-memory unless it is later persisted by an explicit call.
209	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
210	`insert other;`	Performs Salesforce DML: insert other;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
211	`empty.Status__c = 'Draft';`	Assigns the right-hand expression to the named variable/property: empty.Status__c = 'Draft';. This is in-memory unless it is later persisted by an explicit call.
212	`empty.Distributor__c = other.Id;`	Assigns the right-hand expression to the named variable/property: empty.Distributor__c = other.Id;. This is in-memory unless it is later persisted by an explicit call.
213	`System.assertEquals(false, Database.update(empty, false).isSuccess());`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(false, Database.update(empty, false).isSuccess());. A mismatch fails the test.
214	`DMS_Primary_Order__c parent = order();`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Order__c parent = order();. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
215	`DMS_Primary_Order_Line__c bad = new DMS_Primary_Order_Line__c(`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Order_Line__c bad = new DMS_Primary_Order_Line__c(. This is in-memory unless it is later persisted by an explicit call.
216	`Order__c = parent.Id,`	Assigns the right-hand expression to the named variable/property: Order__c = parent.Id,. This is in-memory unless it is later persisted by an explicit call.
217	`Product__c = [SELECT Id FROM Product__c LIMIT 1]`	Assigns the right-hand expression to the named variable/property: Product__c = [SELECT Id FROM Product__c LIMIT 1]. This is in-memory unless it is later persisted by an explicit call.
218	`.Id,`	Continues the surrounding declaration/expression or text: .Id,. Read it with the preceding opening statement (Product__c = [SELECT Id FROM Product__c LIMIT 1]); it is not a standalone business operation.
219	`Cases__c = 0`	Assigns the right-hand expression to the named variable/property: Cases__c = 0. This is in-memory unless it is later persisted by an explicit call.
220	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
221	`System.assertEquals(false, Database.insert(bad, false).isSuccess());`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(false, Database.insert(bad, false).isSuccess());. A mismatch fails the test.
222	`bad.Cases__c = 1;`	Assigns the right-hand expression to the named variable/property: bad.Cases__c = 1;. This is in-memory unless it is later persisted by an explicit call.
223	`bad.Order__c = null;`	Assigns the right-hand expression to the named variable/property: bad.Order__c = null;. This is in-memory unless it is later persisted by an explicit call.
224	`System.assertEquals(false, Database.insert(bad, false).isSuccess());`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(false, Database.insert(bad, false).isSuccess());. A mismatch fails the test.
225	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
226	`@IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.

Line	Source code	Explanation / reading note
227	`    static void handlesBulkLinesAndReparenting() {`	Continues the surrounding declaration/expression or text: static void handlesBulkLinesAndReparenting() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.
228	`        DMS_Primary_Order__c first = order(), second = order();`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Order__c first = order(), second = order();. This is in-memory unless it is later persisted by an explicit call.
229	`        Id productId = [SELECT Id FROM Product__c LIMIT 1].Id;`	Declares/initializes local data used by the surrounding operation: Id productId = [SELECT Id FROM Product__c LIMIT 1].Id;. Collection contents and assignments below determine its purpose.
230	`        List<DMS_Primary_Order_Line__c> lines = new List<DMS_Primary_Order_Line__c>();`	Declares/initializes local data used by the surrounding operation: List<DMS_Primary_Order_Line__c> lines = new List<DMS_Primary_Order_Line__c>();. Collection contents and assignments below determine its purpose.
231	`        for (Integer i = 0; i < 200; i++)`	Repeats work over the specified records/items or while this condition holds: for (Integer i = 0; i < 200; i++). Check where queries/writes occur relative to the loop.
232	`            lines.add(`	Calls the named method: lines.add(. Its implementation defines the side effect/result; use the symbol/file index to follow it.
233	`                new DMS_Primary_Order_Line__c(`	Continues the surrounding declaration/expression or text: new DMS_Primary_Order_Line__c(. Read it with the preceding opening statement (lines.add(); it is not a standalone business operation.
234	`                    Order__c = first.Id,`	Assigns the right-hand expression to the named variable/property: Order__c = first.Id,. This is in-memory unless it is later persisted by an explicit call.
235	`                    Product__c = productId,`	Assigns the right-hand expression to the named variable/property: Product__c = productId,. This is in-memory unless it is later persisted by an explicit call.
236	`                    Cases__c = 1`	Assigns the right-hand expression to the named variable/property: Cases__c = 1. This is in-memory unless it is later persisted by an explicit call.
237	`                )`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
238	`            );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

261	`            Alias = 'dmstesto',`	Assigns the right-hand expression to the named variable/property: Alias = 'dmstesto',. This is in-memory unless it is later persisted by an explicit call.
262	`            Email = 'dms-officer@example.invalid',`	Assigns the right-hand expression to the named variable/property: Email = 'dms-officer@example.invalid',. This is in-memory unless it is later persisted by an explicit call.
263	`            Username = 'dms.officer.' +`	Assigns the right-hand expression to the named variable/property: Username = 'dms.officer.' +. This is in-memory unless it is later persisted by an explicit call.
264	`                UserInfo.getOrganizationId() +`	Calls the named method: UserInfo.getOrganizationId() +. Its implementation defines the side effect/result; use the symbol/file index to follow it.

Line	Source code	Explanation / reading note
265	`'.' +`	Continues the surrounding declaration/expression or text: '.' +. Read it with the preceding opening statement (UserInfo.getOrganizationId() +); it is not a standalone business operation.
266	`System.now().getTime() +`	Calls the named method: System.now().getTime() +. Its implementation defines the side effect/result; use the symbol/file index to follow it.
267	`'@example.invalid',`	Continues the surrounding declaration/expression or text: '@example.invalid',. Read it with the preceding opening statement (System.now().getTime() +); it is not a standalone business operation.
268	`TimeZoneSidKey = 'Asia/Kolkata',`	Assigns the right-hand expression to the named variable/property: TimeZoneSidKey = 'Asia/Kolkata',. This is in-memory unless it is later persisted by an explicit call.
269	`LocaleSidKey = 'en_US',`	Assigns the right-hand expression to the named variable/property: LocaleSidKey = 'en_US',. This is in-memory unless it is later persisted by an explicit call.
270	`EmailEncodingKey = 'UTF-8',`	Assigns the right-hand expression to the named variable/property: EmailEncodingKey = 'UTF-8',. This is in-memory unless it is later persisted by an explicit call.
271	`LanguageLocaleKey = 'en_US',`	Assigns the right-hand expression to the named variable/property: LanguageLocaleKey = 'en_US',. This is in-memory unless it is later persisted by an explicit call.
272	`ProfileId = [SELECT Id FROM Profile WHERE Name = 'Standard Platform User' LIMIT 1]`	Assigns the right-hand expression to the named variable/property: ProfileId = [SELECT Id FROM Profile WHERE Name = 'Standard Platform User' LIMIT 1]. This is in-memory unless it is later persisted by an explicit call.
273	`.Id`	Continues the surrounding declaration/expression or text: .Id. Read it with the preceding opening statement (ProfileId = [SELECT Id FROM Profile WHERE Name = 'Standard Platform User' LIMIT 1]); it is not a standalone business operation.
274	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
275	`System.runAs(new User(Id = UserInfo.getUserId())) {`	Calls the named method: System.runAs(new User(Id = UserInfo.getUserId())) {. Its implementation defines the side effect/result; use the symbol/file index to follow it.
276	`insert officer;`	Performs Salesforce DML: insert officer;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
277	`insert new PermissionSetAssignment(`	Performs Salesforce DML: insert new PermissionSetAssignment(. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.

Line	Source code	Explanation / reading note
278	`AssigneeId = officer.Id,`	Assigns the right-hand expression to the named variable/property: AssigneeId = officer.Id,. This is in-memory unless it is later persisted by an explicit call.
279	`PermissionSetId = [`	Assigns the right-hand expression to the named variable/property: PermissionSetId = [. This is in-memory unless it is later persisted by an explicit call.
280	`SELECT Id`	Selects these Salesforce fields/aggregates: Id. Query results are used in the surrounding assignment or loop.
281	`FROM PermissionSet`	Chooses the Salesforce object/subquery source: FROM PermissionSet.
282	`WHERE Name = 'DMS_Distributor_Officer'`	Adds a query/filter condition: WHERE Name = 'DMS_Distributor_Officer'. The complete condition determines which records are included.
283	`]`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
284	`.Id`	Continues the surrounding declaration/expression or text: .Id. Read it with the preceding opening statement ( ]); it is not a standalone business operation.
285	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
286	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
287	`DMS_Distributor__c distributor = [SELECT Id, Officer__c FROM DMS_Distributor__c LIMIT 1];`	Assigns the right-hand expression to the named variable/property: DMS_Distributor__c distributor = [SELECT Id, Officer__c FROM DMS_Distributor__c LIMIT 1];. This is in-memory unless it is later persisted by an explicit call.
288	`distributor.Officer__c = officer.Id;`	Assigns the right-hand expression to the named variable/property: distributor.Officer__c = officer.Id;. This is in-memory unless it is later persisted by an explicit call.
289	`update distributor;`	Performs Salesforce DML: update distributor;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
290	`DMS_Primary_Order__c parent = order();`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Order__c parent = order();. This is in-memory unless it is later persisted by an explicit call.
291	`DMS_Primary_Order_Line__c line = orderLine(parent.Id);`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Order_Line__c line = orderLine(parent.Id);. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
292	`DMS_Primary_Return__c returned = returnRecord();`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Return__c returned = returnRecord();. This is in-memory unless it is later persisted by an explicit call.
293	`System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.
294	`1,`	Continues the surrounding declaration/expression or text: 1,. Read it with the preceding opening statement (System.assertEquals(); it is not a standalone business operation.
295	`[`	Continues the surrounding declaration/expression or text: [. Read it with the preceding opening statement (1,); it is not a standalone business operation.
296	`SELECT COUNT()`	Selects these Salesforce fields/aggregates: COUNT(). Query results are used in the surrounding assignment or loop.
297	`FROM DMS_Primary_Order__Share`	Chooses the Salesforce object/subquery source: FROM DMS_Primary_Order__Share.
298	`WHERE`	Adds a query/filter condition: WHERE. The complete condition determines which records are included.
299	`ParentId = :parent.Id`	Assigns the right-hand expression to the named variable/property: ParentId = :parent.Id. This is in-memory unless it is later persisted by an explicit call.
300	`AND UserOrGroupId = :officer.Id`	Adds a query/filter condition: AND UserOrGroupId = :officer.Id. The complete condition determines which records are included.
301	`AND RowCause = 'Officer_Access__c'`	Adds a query/filter condition: AND RowCause = 'Officer_Access__c'. The complete condition determines which records are included.
302	`]`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
303	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
304	`System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.
305	`1,`	Continues the surrounding declaration/expression or text: 1,. Read it with the preceding opening statement (System.assertEquals(); it is not a standalone business operation.
306	`[`	Continues the surrounding declaration/expression or text: [. Read it with the preceding opening statement (1,); it is not a standalone business operation.

Line	Source code	Explanation / reading note
307	`SELECT COUNT()`	Selects these Salesforce fields/aggregates: COUNT(). Query results are used in the surrounding assignment or loop.
308	`FROM DMS_Primary_Order_Line__Share`	Chooses the Salesforce object/subquery source: FROM DMS_Primary_Order_Line__Share.
309	`WHERE`	Adds a query/filter condition: WHERE. The complete condition determines which records are included.
310	`ParentId = :line.Id`	Assigns the right-hand expression to the named variable/property: ParentId = :line.Id. This is in-memory unless it is later persisted by an explicit call.
311	`AND UserOrGroupId = :officer.Id`	Adds a query/filter condition: AND UserOrGroupId = :officer.Id. The complete condition determines which records are included.
312	`AND RowCause = 'Officer_Access__c'`	Adds a query/filter condition: AND RowCause = 'Officer_Access__c'. The complete condition determines which records are included.
313	`]`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
314	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

325	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
326	`// A real non-admin, licensed officer must be able to approve the routed work item.`	Developer comment/documentation: A real non-admin, licensed officer must be able to approve the routed work item. It is not executed.
327	`Approval.ProcessSubmitRequest request = new Approval.ProcessSubmitRequest();`	Calls the named method: Approval.ProcessSubmitRequest request = new Approval.ProcessSubmitRequest();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
328	`request.setObjectId(parent.Id);`	Calls the named method: request.setObjectId(parent.Id);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
329	`request.setProcessDefinitionNameOrId('Company_Officer_Approval');`	Calls the named method: request.setProcessDefinitionNameOrId('Company_Officer_Approval');. Its implementation defines the side effect/result; use the symbol/file index to follow it.
330	`Approval.ProcessResult submitted = Approval.process(request);`	Submits the configured Salesforce approval request. Inspect the returned result before claiming submission succeeded.
331	`System.runAs(officer) {`	Calls the named method: System.runAs(officer) {. Its implementation defines the side effect/result; use the symbol/file index to follow it.
332	`decide(submitted, 'Approve');`	Continues the surrounding declaration/expression or text: decide(submitted, 'Approve');. Read it with the preceding opening statement (System.runAs(officer) {); it is not a standalone business operation.
333	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
334	`System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.

Line	Source code	Explanation / reading note
335	`'Approved',`	Continues the surrounding declaration/expression or text: 'Approved',. Read it with the preceding opening statement (System.assertEquals(); it is not a standalone business operation.
336	`[SELECT Status__c FROM DMS_Primary_Order__c WHERE Id = :parent.Id].Status__c`	Assigns the right-hand expression to the named variable/property: [SELECT Status__c FROM DMS_Primary_Order__c WHERE Id = :parent.Id].Status__c. This is in-memory unless it is later persisted by an explicit call.
337	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
338	`// Draft reassignment removes only our managed shares, not other manual grants.`	Developer comment/documentation: Draft reassignment removes only our managed shares, not other manual grants. It is not executed.
339	`distributor.Officer__c = UserInfo.getUserId();`	Calls the named method: distributor.Officer__c = UserInfo.getUserId();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
340	`update distributor;`	Performs Salesforce DML: update distributor;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
341	`update new DMS_Primary_Return__c(Id = returned.Id, Notes__c = 'Refresh draft approver');`	Performs Salesforce DML: update new DMS_Primary_Return__c(Id = returned.Id, Notes__c = 'Refresh draft approver');. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
342	`System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.
343	`0,`	Continues the surrounding declaration/expression or text: 0,. Read it with the preceding opening statement (System.assertEquals(); it is not a standalone business operation.
344	`[`	Continues the surrounding declaration/expression or text: [. Read it with the preceding opening statement (0,); it is not a standalone business operation.
345	`SELECT COUNT()`	Selects these Salesforce fields/aggregates: COUNT(). Query results are used in the surrounding assignment or loop.
346	`FROM DMS_Primary_Return__Share`	Chooses the Salesforce object/subquery source: FROM DMS_Primary_Return__Share.
347	`WHERE ParentId = :returned.Id AND RowCause = 'Officer_Access__c'`	Adds a query/filter condition: WHERE ParentId = :returned.Id AND RowCause = 'Officer_Access__c'. The complete condition determines which records are included.

Line	Source code	Explanation / reading note
348	`            ]`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
349	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
350	`        DmsOfficerSharing.synchronize('DMS_Primary_Order__c', new Set<Id>());`	Calls the named method: DmsOfficerSharing.synchronize('DMS_Primary_Order__c', new Set<Id>());. Its implementation defines the side effect/result; use the symbol/file index to follow it.
351	`        try {`	Starts operations whose failure is handled by the following catch/finally blocks.
352	`            DmsOfficerSharing.synchronize('Employee__c', new Set<Id>{ parent.Id });`	Calls the named method: DmsOfficerSharing.synchronize('Employee__c', new Set<Id>{ parent.Id });. Its implementation defines the side effect/result; use the symbol/file index to follow it.
353	`            System.assert(false, 'Unsupported objects must be rejected.');`	Test assertion comparing an expected outcome to actual behavior: System.assert(false, 'Unsupported objects must be rejected.');. A mismatch fails the test.
354	`        } catch (DmsOfficerSharing.SharingConfigurationException expected) {`	Handles an exception from the preceding try block. Check whether it rolls back, preserves queued work or only displays an error.
355	`        }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
356	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
357	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

force-app/main/default/classes/DmsPrimaryWorkflowTest.cls-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

2 numbered source lines | SHA-256 0347267b36e4cd542616bb80997ae7c7634cf64ed063b5bd68dd2493c8fca3ea

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<ApexClass xmlns="http://soap.sforce.com/2006/04/metadata"><apiVersion>65.0</apiVersion><status>Active</status></ApexClass>`	Sets Apex Class in the enclosing configuration to <apiVersion>65.0</apiVersion><status>Active</status>.

force-app/main/default/classes/DmsReportConfigurationTest.cls

Regression tests for DmsReportConfiguration. Fixture setup creates inputs, the action invokes behavior, and assertions compare actual results to expected outcomes. Tests with stubs do not verify the real mail provider or Salesforce transport.

88 numbered source lines | SHA-256 46b6b372d91023e37436d11f600160da4d7b758772ae160ef09ec6c8ee3d0533

Line	Source code	Explanation / reading note
1	`@IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
2	`private class DmsReportConfigurationTest {`	Declares a class/type: private class DmsReportConfigurationTest {. Members below hold behavior and/or state.
3	`    @IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
4	`    static void targetScopesAreUniqueAndValid() {`	Continues the surrounding declaration/expression or text: static void targetScopesAreUniqueAndValid() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.
5	`        DMS_Distributor__c distributor = new DMS_Distributor__c(`	Assigns the right-hand expression to the named variable/property: DMS_Distributor__c distributor = new DMS_Distributor__c(. This is in-memory unless it is later persisted by an explicit call.
6	`            Name = 'Report fixture',`	Assigns the right-hand expression to the named variable/property: Name = 'Report fixture',. This is in-memory unless it is later persisted by an explicit call.
7	`            Active__c = true,`	Assigns the right-hand expression to the named variable/property: Active__c = true,. This is in-memory unless it is later persisted by an explicit call.
8	`            Officer__c = UserInfo.getUserId()`	Calls the named method: Officer__c = UserInfo.getUserId(). Its implementation defines the side effect/result; use the symbol/file index to follow it.
9	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
10	`        insert distributor;`	Performs Salesforce DML: insert distributor;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
11	`        Date month = Date.today().toStartOfMonth();`	Declares/initializes local data used by the surrounding operation: Date month = Date.today().toStartOfMonth();. Collection contents and assignments below determine its purpose.

71	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
72	`    @IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
73	`    static void routesOrdersAndReturns() {`	Continues the surrounding declaration/expression or text: static void routesOrdersAndReturns() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.
74	`        Id outlet = [SELECT Id FROM Retailer__c WHERE Name = 'Mapped outlet'].Id;`	Declares/initializes local data used by the surrounding operation: Id outlet = [SELECT Id FROM Retailer__c WHERE Name = 'Mapped outlet'].Id;. Collection contents and assignments below determine its purpose.
75	`        Id distributor = [SELECT Id FROM DMS_Distributor__c LIMIT 1].Id;`	Declares/initializes local data used by the surrounding operation: Id distributor = [SELECT Id FROM DMS_Distributor__c LIMIT 1].Id;. Collection contents and assignments below determine its purpose.
76	`        List<Sales_Order__c> orders = new List<Sales_Order__c>();`	Declares/initializes local data used by the surrounding operation: List<Sales_Order__c> orders = new List<Sales_Order__c>();. Collection contents and assignments below determine its purpose.
77	`        for (Integer i = 0; i < 200; i++)`	Repeats work over the specified records/items or while this condition holds: for (Integer i = 0; i < 200; i++). Check where queries/writes occur relative to the loop.
78	`            orders.add(orderFor(outlet, null));`	Calls the named method: orders.add(orderFor(outlet, null));. Its implementation defines the side effect/result; use the symbol/file index to follow it.

Line	Source code	Explanation / reading note
79	`Test.startTest();`	Starts the isolated Apex test execution window and resets the relevant governor-limit counters.
80	`insert orders;`	Performs Salesforce DML: insert orders;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
81	`Product_Return__c returned = new Product_Return__c(`	Assigns the right-hand expression to the named variable/property: Product_Return__c returned = new Product_Return__c(. This is in-memory unless it is later persisted by an explicit call.
82	`Outlet__c = outlet,`	Assigns the right-hand expression to the named variable/property: Outlet__c = outlet,. This is in-memory unless it is later persisted by an explicit call.
83	`Product__c = [SELECT Id FROM Product__c LIMIT 1]`	Assigns the right-hand expression to the named variable/property: Product__c = [SELECT Id FROM Product__c LIMIT 1]. This is in-memory unless it is later persisted by an explicit call.
84	`.Id,`	Continues the surrounding declaration/expression or text: .Id,. Read it with the preceding opening statement (Product__c = [SELECT Id FROM Product__c LIMIT 1]); it is not a standalone business operation.
85	`Quantity__c = 2,`	Assigns the right-hand expression to the named variable/property: Quantity__c = 2,. This is in-memory unless it is later persisted by an explicit call.
86	`Return_Reason__c = 'Damaged'`	Assigns the right-hand expression to the named variable/property: Return_Reason__c = 'Damaged'. This is in-memory unless it is later persisted by an explicit call.
87	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
88	`insert returned;`	Performs Salesforce DML: insert returned;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
89	`Test.stopTest();`	Ends the Apex test window and runs queued test asynchronous work before checking outcomes.
90	`System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.
91	`200,`	Continues the surrounding declaration/expression or text: 200,. Read it with the preceding opening statement (System.assertEquals(); it is not a standalone business operation.

Line	Source code	Explanation / reading note
92	`[`	Continues the surrounding declaration/expression or text: [. Read it with the preceding opening statement (200,); it is not a standalone business operation.
93	`SELECT COUNT()`	Selects these Salesforce fields/aggregates: COUNT(). Query results are used in the surrounding assignment or loop.
94	`FROM Sales_Order__c`	Chooses the Salesforce object/subquery source: FROM Sales_Order__c.
95	`WHERE`	Adds a query/filter condition: WHERE. The complete condition determines which records are included.
96	`DMS_Distributor__c = :distributor`	Assigns the right-hand expression to the named variable/property: DMS_Distributor__c = :distributor. This is in-memory unless it is later persisted by an explicit call.
97	`AND DMS_Status__c = 'Approved'`	Adds a query/filter condition: AND DMS_Status__c = 'Approved'. The complete condition determines which records are included.
98	`AND DMS_Decided_At__c != NULL`	Adds a query/filter condition: AND DMS_Decided_At__c != NULL. The complete condition determines which records are included.
99	`]`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
100	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
101	`System.assertEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(. A mismatch fails the test.
102	`'Automatically approved secondary order.',`	Continues the surrounding declaration/expression or text: 'Automatically approved secondary order.',. Read it with the preceding opening statement (System.assertEquals(); it is not a standalone business operation.

2	`<ApexClass xmlns="http://soap.sforce.com/2006/04/metadata"><apiVersion>65.0</apiVersion><status>Active</status></ApexClass>`	Sets Apex Class in the enclosing configuration to <apiVersion>65.0</apiVersion><status>Active</status>.

force-app/main/default/classes/DmsTransactionApi.cls

Older separate Apex REST endpoint for primary orders and secondary decisions. Current DmsTransport uses DmsPortalApi instead. Compile repairs do not remove its remaining security/test review needs.

Line	Source code	Explanation / reading note
1	`/** Transaction boundary for the trusted backend. No inventory writes occur here. */`	Developer comment/documentation: Transaction boundary for the trusted backend. No inventory writes occur here. */ It is not executed.
2	`@RestResource(urlMapping='/dms/transactions/*')`	Registers the Apex REST URL mapping; authentication/authorization must still be enforced.
3	`global with sharing class DmsTransactionApi {`	Declares a class/type: global with sharing class DmsTransactionApi {. Uses record sharing, which does not alone enforce field/object permissions.
4	`    public class InputException extends Exception {`	Declares a class/type: public class InputException extends Exception {. Members below hold behavior and/or state.
5	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
6	`    public class LineInput {`	Declares a class/type: public class LineInput {. Members below hold behavior and/or state.
7	`        public Id productId;`	Continues the surrounding declaration/expression or text: public Id productId;. Read it with the preceding opening statement (public class LineInput {); it is not a standalone business operation.
8	`        public Decimal cases;`	Continues the surrounding declaration/expression or text: public Decimal cases;. Read it with the preceding opening statement (public Id productId;); it is not a standalone business operation.
9	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
10	`    public class RequestBody {`	Declares a class/type: public class RequestBody {. Members below hold behavior and/or state.
11	`        public String action;`	Continues the surrounding declaration/expression or text: public String action;. Read it with the preceding opening statement (public class RequestBody {); it is not a standalone business operation.

Line	Source code	Explanation / reading note
12	`public Id employeeId;`	Continues the surrounding declaration/expression or text: public Id employeeId;. Read it with the preceding opening statement (public String action;); it is not a standalone business operation.
13	`public Id distributorId;`	Continues the surrounding declaration/expression or text: public Id distributorId;. Read it with the preceding opening statement (public Id employeeId;); it is not a standalone business operation.
14	`public Id orderId;`	Continues the surrounding declaration/expression or text: public Id orderId;. Read it with the preceding opening statement (public Id distributorId;); it is not a standalone business operation.
15	`public String requestKey;`	Continues the surrounding declaration/expression or text: public String requestKey;. Read it with the preceding opening statement (public Id orderId;); it is not a standalone business operation.
16	`public String decision;`	Continues the surrounding declaration/expression or text: public String decision;. Read it with the preceding opening statement (public String requestKey;); it is not a standalone business operation.
17	`public String notes;`	Continues the surrounding declaration/expression or text: public String notes;. Read it with the preceding opening statement (public String decision;); it is not a standalone business operation.
18	`public List<LineInput> lines;`	Continues the surrounding declaration/expression or text: public List<LineInput> lines;. Read it with the preceding opening statement (public String notes;); it is not a standalone business operation.
19	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
20	`@HttpPost`	Associates the following Apex method with the indicated HTTP verb.
21	`global static void execute() {`	Declares a callable function/method: global static void execute() {. Parameters supply its inputs; the following block implements the operation.
22	`RestContext.response.addHeader('Content-Type', 'application/json');`	Calls the named method: RestContext.response.addHeader('Content-Type', 'application/json');. Its implementation defines the side effect/result; use the symbol/file index to follow it.
23	`RestContext.response.responseBody = Blob.valueOf(JSON.serialize(handle()));`	Converts structured data to JSON for HTTP, persistent storage or a fingerprint.

Line	Source code	Explanation / reading note
24	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
25		Blank line separating logical sections; no executable operation.
26	`    // Keep the existing JSON success/error envelope while using a valid Apex REST signature.`	Developer comment/documentation: Keep the existing JSON success/error envelope while using a valid Apex REST signature. It is not executed.
27	`    private static Map<String, Object> handle() {`	Declares a callable function/method: private static Map<String, Object> handle() {. Parameters supply its inputs; the following block implements the operation.
28	`        Savepoint checkpoint = Database.setSavepoint();`	Creates a transaction checkpoint so later failure can roll back all command changes.
29	`        try {`	Starts operations whose failure is handled by the following catch/finally blocks.
30	`            RequestBody request = (RequestBody) JSON.deserialize(`	Converts JSON into structured data. Invalid JSON can throw; inspect validation and catch handling.
31	`                RestContext.request.requestBody.toString(),`	Calls the named method: RestContext.request.requestBody.toString(),. Its implementation defines the side effect/result; use the symbol/file index to follow it.
32	`                RequestBody.class`	Continues the surrounding declaration/expression or text: RequestBody.class. Read it with the preceding opening statement (RestContext.request.requestBody.toString(),); it is not a standalone business operation.
33	`            );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
34	`            if (request.action == 'primaryOrder')`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (request.action == 'primaryOrder').
35	`                return createPrimary(request);`	Returns createPrimary(request) to the caller (or begins returned UI markup) and ends this execution path.
36	`            if (request.action == 'secondaryDecision')`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (request.action == 'secondaryDecision').
37	`                return decideSecondary(request);`	Returns decideSecondary(request) to the caller (or begins returned UI markup) and ends this execution path.
38	`            throw new InputException('Unknown transaction.');`	Stops this execution path with a validation/error exception: throw new InputException('Unknown transaction.');. The caller/catch block decides how it is reported.

Line	Source code	Explanation / reading note
39	`        } catch (Exception error) {`	Handles an exception from the preceding try block. Check whether it rolls back, preserves queued work or only displays an error.
40	`            Database.rollback(checkpoint);`	Rolls Salesforce writes back to the saved checkpoint; prevents partial command results.
41	`            RestContext.response.statusCode = 400;`	Assigns the right-hand expression to the named variable/property: RestContext.response.statusCode = 400;. This is in-memory unless it is later persisted by an explicit call.
42	`            return new Map<String, Object>{`	Returns new Map<String, Object>{ to the caller (or begins returned UI markup) and ends this execution path.
43	`                'error' => error instanceof InputException`	Continues the surrounding declaration/expression or text: 'error' => error instanceof InputException. Read it with the preceding opening statement (return new Map<String, Object>{); it is not a standalone business operation.
44	`                    ? error.getMessage()`	Calls the named method: ? error.getMessage(). Its implementation defines the side effect/result; use the symbol/file index to follow it.
45	`                    : 'The Salesforce transaction could not be completed. Ask the administrator to check configuration and access.'`	Continues the surrounding declaration/expression or text: : 'The Salesforce transaction could not be completed. Ask the administrator to check configuration and access.'. Read it with the preceding opening statement (? error.getMessage()); it is not a standalone business operation.
46	`            };`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
47	`        }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
48	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
49	`    public static Map<String, Object> createPrimary(RequestBody request) {`	Declares a callable function/method: public static Map<String, Object> createPrimary(RequestBody request) {. Parameters supply its inputs; the following block implements the operation.
50	`        if (`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (.

Line	Source code	Explanation / reading note
51	`String.isBlank(request.requestKey) ||`	Declares/initializes local data used by the surrounding operation: String.isBlank(request.requestKey) ||. Collection contents and assignments below determine its purpose.
52	`!Pattern.matches('[A-Za-z0-9-]{16,80}', request.requestKey)`	Calls the named method: !Pattern.matches('[A-Za-z0-9-]{16,80}', request.requestKey). Its implementation defines the side effect/result; use the symbol/file index to follow it.
53	`)`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
54	`throw new InputException('A valid request key is required.');`	Stops this execution path with a validation/error exception: throw new InputException('A valid request key is required.');. The caller/catch block decides how it is reported.
55	`if (`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (.
56	`[SELECT COUNT() FROM Employee__c WHERE Id = :request.employeeId AND Active__c = TRUE] !=`	Assigns the right-hand expression to the named variable/property: [SELECT COUNT() FROM Employee__c WHERE Id = :request.employeeId AND Active__c = TRUE] !=. This is in-memory unless it is later persisted by an explicit call.
57	`1`	Continues the surrounding declaration/expression or text: 1. Read it with the preceding opening statement ([SELECT COUNT() FROM Employee__c WHERE Id = :request.employeeId AND Active__c = TRUE] !=); it is not a standalone business operation.
58	`)`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
59	`throw new InputException('Employee is not active.');`	Stops this execution path with a validation/error exception: throw new InputException('Employee is not active.');. The caller/catch block decides how it is reported.
60	`List<DMS_Primary_Order__c> existing = [`	Declares/initializes local data used by the surrounding operation: List<DMS_Primary_Order__c> existing = [. Collection contents and assignments below determine its purpose.
61	`SELECT Id, Status__c, Employee__c`	Selects these Salesforce fields/aggregates: Id, Status__c, Employee__c. Query results are used in the surrounding assignment or loop.
62	`FROM DMS_Primary_Order__c`	Chooses the Salesforce object/subquery source: FROM DMS_Primary_Order__c.
63	`WHERE Request_Key__c = :request.requestKey`	Adds a query/filter condition: WHERE Request_Key__c = :request.requestKey. The complete condition determines which records are included.

Line	Source code	Explanation / reading note
64	`            LIMIT 1`	Controls query sorting, grouping or result count: LIMIT 1.
65	`        ];`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
66	`        if (!existing.isEmpty()) {`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!existing.isEmpty()) {.
67	`            if (existing[0].Employee__c != request.employeeId)`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (existing[0].Employee__c != request.employeeId).
68	`                throw new InputException('Request key belongs to another employee.');`	Stops this execution path with a validation/error exception: throw new InputException('Request key belongs to another employee.');. The caller/catch block decides how it is reported.
69	`            return new Map<String, Object>{`	Returns new Map<String, Object>{ to the caller (or begins returned UI markup) and ends this execution path.
70	`                'id' => existing[0].Id,`	Continues the surrounding declaration/expression or text: 'id' => existing[0].Id,. Read it with the preceding opening statement (return new Map<String, Object>{); it is not a standalone business operation.
71	`                'status' => existing[0].Status__c`	Continues the surrounding declaration/expression or text: 'status' => existing[0].Status__c. Read it with the preceding opening statement ('id' => existing[0].Id,); it is not a standalone business operation.
72	`            };`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
73	`        }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
74	`        List<DMS_Distributor__c> distributors = [`	Declares/initializes local data used by the surrounding operation: List<DMS_Distributor__c> distributors = [. Collection contents and assignments below determine its purpose.
75	`            SELECT Id, Officer__c, Officer__r.IsActive`	Selects these Salesforce fields/aggregates: Id, Officer__c, Officer__r.IsActive. Query results are used in the surrounding assignment or loop.
76	`            FROM DMS_Distributor__c`	Chooses the Salesforce object/subquery source: FROM DMS_Distributor__c.
77	`            WHERE Id = :request.distributorId AND Active__c = TRUE`	Adds a query/filter condition: WHERE Id = :request.distributorId AND Active__c = TRUE. The complete condition determines which records are included.

Line	Source code	Explanation / reading note
78	`            LIMIT 1`	Controls query sorting, grouping or result count: LIMIT 1.

Line	Source code	Explanation / reading note
130	`product.DMS_Case_Price__c == null ||`	Continues the surrounding declaration/expression or text: product.DMS_Case_Price__c == null ||. Read it with the preceding opening statement (product == null ||); it is not a standalone business operation.
131	`product.DMS_Case_Price__c <= 0 ||`	Continues the surrounding declaration/expression or text: product.DMS_Case_Price__c <= 0 ||. Read it with the preceding opening statement (product.DMS_Case_Price__c == null ||); it is not a standalone business operation.
132	`product.Units_Per_Case__c == null ||`	Continues the surrounding declaration/expression or text: product.Units_Per_Case__c == null ||. Read it with the preceding opening statement (product.DMS_Case_Price__c <= 0 ||); it is not a standalone business operation.
133	`product.Units_Per_Case__c <= 0 ||`	Continues the surrounding declaration/expression or text: product.Units_Per_Case__c <= 0 ||. Read it with the preceding opening statement (product.Units_Per_Case__c == null ||); it is not a standalone business operation.
134	`product.Units_Per_Case__c != product.Units_Per_Case__c.setScale(0)`	Calls the named method: product.Units_Per_Case__c != product.Units_Per_Case__c.setScale(0). Its implementation defines the side effect/result; use the symbol/file index to follow it.
135	`)`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
136	`throw new InputException(`	Stops this execution path with a validation/error exception: throw new InputException(. The caller/catch block decides how it is reported.
137	`'Each product needs a positive Primary Case Price and whole Units Per Case in Salesforce.'`	Continues the surrounding declaration/expression or text: 'Each product needs a positive Primary Case Price and whole Units Per Case in Salesforce.'. Read it with the preceding opening statement (throw new InputException(); it is not a standalone business operation.
138	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
139	`Decimal tax = product.GST_Percent__c == null ? 0 : product.GST_Percent__c;`	Declares/initializes local data used by the surrounding operation: Decimal tax = product.GST_Percent__c == null ? 0 : product.GST_Percent__c;. Collection contents and assignments below determine its purpose.
140	`total += (input.cases * product.DMS_Case_Price__c * (1 + tax / 100)).setScale(2);`	Assigns the right-hand expression to the named variable/property: total += (input.cases * product.DMS_Case_Price__c * (1 + tax / 100)).setScale(2);. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
141	`lines.add(`	Calls the named method: lines.add(. Its implementation defines the side effect/result; use the symbol/file index to follow it.
142	`new DMS_Primary_Order_Line__c(`	Continues the surrounding declaration/expression or text: new DMS_Primary_Order_Line__c(. Read it with the preceding opening statement (lines.add(); it is not a standalone business operation.
143	`Product__c = product.Id,`	Assigns the right-hand expression to the named variable/property: Product__c = product.Id,. This is in-memory unless it is later persisted by an explicit call.
144	`Cases__c = input.cases,`	Assigns the right-hand expression to the named variable/property: Cases__c = input.cases,. This is in-memory unless it is later persisted by an explicit call.
145	`Pieces_Per_Case__c = product.Units_Per_Case__c,`	Assigns the right-hand expression to the named variable/property: Pieces_Per_Case__c = product.Units_Per_Case__c,. This is in-memory unless it is later persisted by an explicit call.
146	`Case_Price__c = product.DMS_Case_Price__c,`	Assigns the right-hand expression to the named variable/property: Case_Price__c = product.DMS_Case_Price__c,. This is in-memory unless it is later persisted by an explicit call.
147	`Tax_Percent__c = tax`	Assigns the right-hand expression to the named variable/property: Tax_Percent__c = tax. This is in-memory unless it is later persisted by an explicit call.
148	`)`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
149	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
150	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
151	`DMS_Primary_Order__c order = new DMS_Primary_Order__c(`	Assigns the right-hand expression to the named variable/property: DMS_Primary_Order__c order = new DMS_Primary_Order__c(. This is in-memory unless it is later persisted by an explicit call.
152	`Distributor__c = request.distributorId,`	Assigns the right-hand expression to the named variable/property: Distributor__c = request.distributorId,. This is in-memory unless it is later persisted by an explicit call.
153	`Employee__c = request.employeeId,`	Assigns the right-hand expression to the named variable/property: Employee__c = request.employeeId,. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
154	`Officer__c = distributors[0].Officer__c,`	Assigns the right-hand expression to the named variable/property: Officer__c = distributors[0].Officer__c,. This is in-memory unless it is later persisted by an explicit call.
155	`Request_Key__c = request.requestKey,`	Assigns the right-hand expression to the named variable/property: Request_Key__c = request.requestKey,. This is in-memory unless it is later persisted by an explicit call.
156	`Notes__c = request.notes,`	Assigns the right-hand expression to the named variable/property: Notes__c = request.notes,. This is in-memory unless it is later persisted by an explicit call.
157	`Status__c = 'Draft',`	Assigns the right-hand expression to the named variable/property: Status__c = 'Draft',. This is in-memory unless it is later persisted by an explicit call.
158	`Total_Amount__c = total`	Assigns the right-hand expression to the named variable/property: Total_Amount__c = total. This is in-memory unless it is later persisted by an explicit call.
159	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
160	`insert order;`	Performs Salesforce DML: insert order;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
161	`for (DMS_Primary_Order_Line__c line : lines)`	Repeats work over the specified records/items or while this condition holds: for (DMS_Primary_Order_Line__c line : lines). Check where queries/writes occur relative to the loop.
162	`line.Order__c = order.Id;`	Assigns the right-hand expression to the named variable/property: line.Order__c = order.Id;. This is in-memory unless it is later persisted by an explicit call.
163	`insert lines;`	Performs Salesforce DML: insert lines;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
164	`Approval.ProcessSubmitRequest approvalRequest = new Approval.ProcessSubmitRequest();`	Calls the named method: Approval.ProcessSubmitRequest approvalRequest = new Approval.ProcessSubmitRequest();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
165	`approvalRequest.setObjectId(order.Id);`	Calls the named method: approvalRequest.setObjectId(order.Id);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
166	`approvalRequest.setProcessDefinitionNameOrId('Company_Officer_Approval');`	Calls the named method: approvalRequest.setProcessDefinitionNameOrId('Company_Officer_Approval');. Its implementation defines the side effect/result; use the symbol/file index to follow it.

Line	Source code	Explanation / reading note
167	`        Approval.ProcessResult result = Approval.process(approvalRequest);`	Submits the configured Salesforce approval request. Inspect the returned result before claiming submission succeeded.
168	`        if (!result.isSuccess())`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!result.isSuccess()).
169	`            throw new InputException('Unable to submit to the company officer.');`	Stops this execution path with a validation/error exception: throw new InputException('Unable to submit to the company officer.');. The caller/catch block decides how it is reported.
170	`        return new Map<String, Object>{ 'id' => order.Id, 'status' => 'Submitted' };`	Returns new Map<String, Object>{ 'id' => order.Id, 'status' => 'Submitted' } to the caller (or begins returned UI markup) and ends this execution path.
171	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
172	`    public static Map<String, Object> decideSecondary(RequestBody request) {`	Declares a callable function/method: public static Map<String, Object> decideSecondary(RequestBody request) {. Parameters supply its inputs; the following block implements the operation.
173	`        if (!new Set<String>{ 'Approved', 'Rejected' }.contains(request.decision))`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!new Set<String>{ 'Approved', 'Rejected' }.contains(request.decision)).
174	`            throw new InputException('Choose Approve or Reject.');`	Stops this execution path with a validation/error exception: throw new InputException('Choose Approve or Reject.');. The caller/catch block decides how it is reported.
175	`        if (request.decision == 'Rejected' && String.isBlank(request.notes))`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (request.decision == 'Rejected' && String.isBlank(request.notes)).
176	`            throw new InputException('Enter a rejection reason.');`	Stops this execution path with a validation/error exception: throw new InputException('Enter a rejection reason.');. The caller/catch block decides how it is reported.
177	`        if (`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (.
178	`            [`	Continues the surrounding declaration/expression or text: [. Read it with the preceding opening statement (if (); it is not a standalone business operation.
179	`                SELECT COUNT()`	Selects these Salesforce fields/aggregates: COUNT(). Query results are used in the surrounding assignment or loop.

Line	Source code	Explanation / reading note
180	`                FROM DMS_Distributor__c`	Chooses the Salesforce object/subquery source: FROM DMS_Distributor__c.
181	`                WHERE Id = :request.distributorId AND Active__c = TRUE`	Adds a query/filter condition: WHERE Id = :request.distributorId AND Active__c = TRUE. The complete condition determines which records are included.
182	`            ] != 1`	Continues the surrounding declaration/expression or text:] != 1. Read it with the preceding opening statement (WHERE Id = :request.distributorId AND Active__c = TRUE); it is not a standalone business operation.
183	`        )`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
184	`            throw new InputException('Distributor is inactive.');`	Stops this execution path with a validation/error exception: throw new InputException('Distributor is inactive.');. The caller/catch block decides how it is reported.
185	`        List<Sales_Order__c> orders = [`	Declares/initializes local data used by the surrounding operation: List<Sales_Order__c> orders = [. Collection contents and assignments below determine its purpose.
186	`            SELECT Id, DMS_Status__c`	Selects these Salesforce fields/aggregates: Id, DMS_Status__c. Query results are used in the surrounding assignment or loop.
187	`            FROM Sales_Order__c`	Chooses the Salesforce object/subquery source: FROM Sales_Order__c.
188	`            WHERE Id = :request.orderId AND DMS_Distributor__c = : request.distributorId`	Adds a query/filter condition: WHERE Id = :request.orderId AND DMS_Distributor__c = :request.distributorId. The complete condition determines which records are included.
189	`            LIMIT 1`	Controls query sorting, grouping or result count: LIMIT 1.
190	`            FOR UPDATE`	Requests record locks for this query so concurrent commands cannot both use the same old state.
191	`        ];`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
192	`        if (orders.isEmpty())`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (orders.isEmpty()).
193	`            throw new InputException('Order is not assigned to this distributor.');`	Stops this execution path with a validation/error exception: throw new InputException('Order is not assigned to this distributor.');. The caller/catch block decides how it is reported.
194	`        Sales_Order__c order = orders[0];`	Assigns the right-hand expression to the named variable/property: Sales_Order__c order = orders[0];. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
195	`        if (order.DMS_Status__c == request.decision)`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (order.DMS_Status__c == request.decision).
196	`            return new Map<String, Object>{ 'id' => order.Id, 'status' => order.DMS_Status__c };`	Returns new Map<String, Object>{ 'id' => order.Id, 'status' => order.DMS_Status__c } to the caller (or begins returned UI markup) and ends this execution path.
197	`        if (order.DMS_Status__c != null && order.DMS_Status__c != 'Pending')`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (order.DMS_Status__c != null && order.DMS_Status__c != 'Pending').
198	`            throw new InputException('This order has already been decided.');`	Stops this execution path with a validation/error exception: throw new InputException('This order has already been decided.');. The caller/catch block decides how it is reported.
199	`        order.DMS_Status__c = request.decision;`	Assigns the right-hand expression to the named variable/property: order.DMS_Status__c = request.decision;. This is in-memory unless it is later persisted by an explicit call.
200	`        order.DMS_Decision_Notes__c = request.notes;`	Assigns the right-hand expression to the named variable/property: order.DMS_Decision_Notes__c = request.notes;. This is in-memory unless it is later persisted by an explicit call.
201	`        order.DMS_Decided_At__c = System.now();`	Calls the named method: order.DMS_Decided_At__c = System.now();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
202	`        update order;`	Performs Salesforce DML: update order;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
203	`        return new Map<String, Object>{ 'id' => order.Id, 'status' => order.DMS_Status__c };`	Returns new Map<String, Object>{ 'id' => order.Id, 'status' => order.DMS_Status__c } to the caller (or begins returned UI markup) and ends this execution path.
204	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
205	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

force-app/main/default/classes/DmsTransactionApi.cls-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

2 numbered source lines | SHA-256 0347267b36e4cd542616bb80997ae7c7634cf64ed063b5bd68dd2493c8fca3ea

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<ApexClass xmlns="http://soap.sforce.com/2006/04/metadata"><apiVersion>65.0</apiVersion><status>Active</status></ApexClass>`	Sets Apex Class in the enclosing configuration to <apiVersion>65.0</apiVersion><status>Active</status>.

force-app/main/default/classes/DmsTriggerHandlersTest.cls

Focused tests for extracted handlers: 200 targets, 200 surveys with valid/invalid ownership, query count and historical officer preservation.

94 numbered source lines | SHA-256 8dda866aa5ab60c437cae990d69ecf3b506d638d1a1ce007c901aa639ce8cc2a

67	`            Name = 'Survey edit fixture',`	Assigns the right-hand expression to the named variable/property: Name = 'Survey edit fixture',. This is in-memory unless it is later persisted by an explicit call.
68	`            Active__c = true,`	Assigns the right-hand expression to the named variable/property: Active__c = true,. This is in-memory unless it is later persisted by an explicit call.
69	`            Officer__c = UserInfo.getUserId()`	Calls the named method: Officer__c = UserInfo.getUserId(). Its implementation defines the side effect/result; use the symbol/file index to follow it.
70	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
71	`        insert distributor;`	Performs Salesforce DML: insert distributor;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
72	`        // Exercise the update branch without creating a real survey or sending mail.`	Developer comment/documentation: Exercise the update branch without creating a real survey or sending mail. It is not executed.
73	`        Id surveyId = (Id) (DMS_Distributor_Survey__c.SObjectType.getDescribe().getKeyPrefix() +`	Declares/initializes local data used by the surrounding operation: Id surveyId = (Id) (DMS_Distributor_Survey__c.SObjectType.getDescribe().getKeyPrefix() +. Collection contents and assignments below determine its purpose.

Line	Source code	Explanation / reading note
74	`'000000000001');`	Continues the surrounding declaration/expression or text: '000000000001');. Read it with the preceding opening statement (Id surveyId = (Id) (DMS_Distributor_Survey__c.SObjectType.getDescribe().getKeyPrefix() +); it is not a standalone business operation.
75	`DMS_Distributor_Survey__c previous = new DMS_Distributor_Survey__c(`	Assigns the right-hand expression to the named variable/property: DMS_Distributor_Survey__c previous = new DMS_Distributor_Survey__c(. This is in-memory unless it is later persisted by an explicit call.
76	`Id = surveyId,`	Declares/initializes local data used by the surrounding operation: Id = surveyId,. Collection contents and assignments below determine its purpose.
77	`Distributor__c = distributor.Id,`	Assigns the right-hand expression to the named variable/property: Distributor__c = distributor.Id,. This is in-memory unless it is later persisted by an explicit call.
78	`Officer__c = null`	Assigns the right-hand expression to the named variable/property: Officer__c = null. This is in-memory unless it is later persisted by an explicit call.
79	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
80	`DMS_Distributor_Survey__c edited = new DMS_Distributor_Survey__c(`	Assigns the right-hand expression to the named variable/property: DMS_Distributor_Survey__c edited = new DMS_Distributor_Survey__c(. This is in-memory unless it is later persisted by an explicit call.
81	`Id = surveyId,`	Declares/initializes local data used by the surrounding operation: Id = surveyId,. Collection contents and assignments below determine its purpose.
82	`Distributor__c = distributor.Id,`	Assigns the right-hand expression to the named variable/property: Distributor__c = distributor.Id,. This is in-memory unless it is later persisted by an explicit call.
83	`Officer__c = UserInfo.getUserId()`	Calls the named method: Officer__c = UserInfo.getUserId(). Its implementation defines the side effect/result; use the symbol/file index to follow it.
84	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
85	`Test.startTest();`	Starts the isolated Apex test execution window and resets the relevant governor-limit counters.
86	`DmsDistributorSurveyHandler.validateOfficer(`	Calls the named method: DmsDistributorSurveyHandler.validateOfficer(. Its implementation defines the side effect/result; use the symbol/file index to follow it.

Line	Source code	Explanation / reading note
87	`            new List<DMS_Distributor_Survey__c>{ edited },`	Continues the surrounding declaration/expression or text: new List<DMS_Distributor_Survey__c>{ edited },. Read it with the preceding opening statement (DmsDistributorSurveyHandler.validateOfficer(); it is not a standalone business operation.
88	`            new Map<Id, DMS_Distributor_Survey__c>{ surveyId => previous }`	Continues the surrounding declaration/expression or text: new Map<Id, DMS_Distributor_Survey__c>{ surveyId => previous }. Read it with the preceding opening statement (new List<DMS_Distributor_Survey__c>{ edited },); it is not a standalone business operation.
89	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
90	`        Test.stopTest();`	Ends the Apex test window and runs queued test asynchronous work before checking outcomes.
91	`        System.assertEquals(false, edited.hasErrors(), 'The assigned officer may edit.');`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(false, edited.hasErrors(), 'The assigned officer may edit.');. A mismatch fails the test.
92	`        System.assertEquals(null, edited.Officer__c, 'Preserve the historical author value.');`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(null, edited.Officer__c, 'Preserve the historical author value.');. A mismatch fails the test.
93	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
94	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

force-app/main/default/classes/DmsTriggerHandlersTest.cls-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

2 numbered source lines | SHA-256 0347267b36e4cd542616bb80997ae7c7634cf64ed063b5bd68dd2493c8fca3ea

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<ApexClass xmlns="http://soap.sforce.com/2006/04/metadata"><apiVersion>65.0</apiVersion><status>Active</status></ApexClass>`	Sets Apex Class in the enclosing configuration to <apiVersion>65.0</apiVersion><status>Active</status>.

force-app/main/default/classes/PjpPlannerController.cls

Older daily/monthly PJP controller using Pending status. Retained for compatibility; the current monthly LWC calls SfaPhaseOnePjpController instead. Its authorization differs and needs review.

116	`        if (managers.isEmpty())`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (managers.isEmpty()).
117	`            return new List<Permanent_Journey_Plan__c>();`	Returns new List<Permanent_Journey_Plan__c>() to the caller (or begins returned UI markup) and ends this execution path.
118	`        return [`	Returns [to the caller (or begins returned UI markup) and ends this execution path.
119	`            SELECT Id, Name, Plan_Date__c, Employee__r.Name, Beat__r.Name, Status__c`	Selects these Salesforce fields/aggregates: Id, Name, Plan_Date__c, Employee__r.Name, Beat__r.Name, Status__c. Query results are used in the surrounding assignment or loop.
120	`            FROM Permanent_Journey_Plan__c`	Chooses the Salesforce object/subquery source: FROM Permanent_Journey_Plan__c.
121	`            WHERE Approver__c = :managers[0].Id AND Status__c = 'Pending'`	Adds a query/filter condition: WHERE Approver__c = :managers[0].Id AND Status__c = 'Pending'. The complete condition determines which records are included.
122	`            ORDER BY Plan_Date__c`	Controls query sorting, grouping or result count: ORDER BY Plan_Date__c.
123	`        ];`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
124	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
125		Blank line separating logical sections; no executable operation.
126	`    @AuraEnabled`	Exposes this method/property to Lightning. cacheable=true is for reads; the annotation is not a permission check.

Line	Source code	Explanation / reading note
127	`    public static void decidePlan(Id planId, Boolean approve, String rejectionReason) {`	Declares a callable function/method: public static void decidePlan(Id planId, Boolean approve, String rejectionReason) {. Parameters supply its inputs; the following block implements the operation.
128	`        Permanent_Journey_Plan__c plan = [`	Assigns the right-hand expression to the named variable/property: Permanent_Journey_Plan__c plan = [. This is in-memory unless it is later persisted by an explicit call.
129	`            SELECT Id, Status__c`	Selects these Salesforce fields/aggregates: Id, Status__c. Query results are used in the surrounding assignment or loop.
130	`            FROM Permanent_Journey_Plan__c`	Chooses the Salesforce object/subquery source: FROM Permanent_Journey_Plan__c.
131	`            WHERE Id = :planId`	Adds a query/filter condition: WHERE Id = :planId. The complete condition determines which records are included.
132	`            LIMIT 1`	Controls query sorting, grouping or result count: LIMIT 1.
133	`            FOR UPDATE`	Requests record locks for this query so concurrent commands cannot both use the same old state.
134	`        ];`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
135	`        if (plan.Status__c != 'Pending')`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (plan.Status__c != 'Pending').
136	`            throw new AuraHandledException('This plan is no longer pending approval.');`	Stops this execution path with a validation/error exception: throw new AuraHandledException('This plan is no longer pending approval.');. The caller/catch block decides how it is reported.
137	`        if (!approve && String.isBlank(rejectionReason))`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!approve && String.isBlank(rejectionReason)).
138	`            throw new AuraHandledException('Enter a rejection reason.');`	Stops this execution path with a validation/error exception: throw new AuraHandledException('Enter a rejection reason.');. The caller/catch block decides how it is reported.
139	`        plan.Status__c = approve ? 'Approved' : 'Rejected';`	Assigns the right-hand expression to the named variable/property: plan.Status__c = approve ? 'Approved' : 'Rejected';. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
140	`plan.Rejection_Reason__c = approve ? null : rejectionReason.trim();`	Calls the named method: plan.Rejection_Reason__c = approve ? null : rejectionReason.trim();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
141	`update plan;`	Performs Salesforce DML: update plan;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
142	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
143		Blank line separating logical sections; no executable operation.
144	`private static void sendManagerNotification(`	Declares a callable function/method: private static void sendManagerNotification(. Parameters supply its inputs; the following block implements the operation.
145	`List<Permanent_Journey_Plan__c> plans,`	Declares/initializes local data used by the surrounding operation: List<Permanent_Journey_Plan__c> plans,. Collection contents and assignments below determine its purpose.
146	`Id employeeId,`	Declares/initializes local data used by the surrounding operation: Id employeeId,. Collection contents and assignments below determine its purpose.
147	`Date monthStart`	Declares/initializes local data used by the surrounding operation: Date monthStart. Collection contents and assignments below determine its purpose.
148	`) {`	Continues the surrounding declaration/expression or text:) {. Read it with the preceding opening statement (Date monthStart); it is not a standalone business operation.
149	`Set<String> recipients = new Set<String>();`	Declares/initializes local data used by the surrounding operation: Set<String> recipients = new Set<String>();. Collection contents and assignments below determine its purpose.
150	`for (Permanent_Journey_Plan__c plan : plans) {`	Repeats work over the specified records/items or while this condition holds: for (Permanent_Journey_Plan__c plan : plans) {. Check where queries/writes occur relative to the loop.
151	`if (plan.Approver__r.Salesforce_User__c != null)`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (plan.Approver__r.Salesforce_User__c != null).
152	`recipients.add(String.valueOf(plan.Approver__r.Salesforce_User__c));`	Calls the named method: recipients.add(String.valueOf(plan.Approver__r.Salesforce_User__c));. Its implementation defines the side effect/result; use the symbol/file index to follow it.

Line	Source code	Explanation / reading note
153	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
154	`if (recipients.isEmpty())`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (recipients.isEmpty()).
155	`return;`	Returns to the caller (or begins returned UI markup) and ends this execution path.
156	`List<CustomNotificationType> types = [`	Declares/initializes local data used by the surrounding operation: List<CustomNotificationType> types = [. Collection contents and assignments below determine its purpose.
157	`SELECT Id`	Selects these Salesforce fields/aggregates: Id. Query results are used in the surrounding assignment or loop.
158	`FROM CustomNotificationType`	Chooses the Salesforce object/subquery source: FROM CustomNotificationType.
159	`WHERE DeveloperName = 'PJP_Approval_Notification'`	Adds a query/filter condition: WHERE DeveloperName = 'PJP_Approval_Notification'. The complete condition determines which records are included.
160	`LIMIT 1`	Controls query sorting, grouping or result count: LIMIT 1.
161	`];`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
162	`if (types.isEmpty())`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (types.isEmpty()).
163	`return;`	Returns to the caller (or begins returned UI markup) and ends this execution path.
164	`Messaging.CustomNotification notice = new Messaging.CustomNotification();`	Calls the named method: Messaging.CustomNotification notice = new Messaging.CustomNotification();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
165	`notice.setNotificationTypeId(types[0].Id);`	Calls the named method: notice.setNotificationTypeId(types[0].Id);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
166	`notice.setTitle('PJP approval required');`	Calls the named method: notice.setTitle('PJP approval required');. Its implementation defines the side effect/result; use the symbol/file index to follow it.
167	`notice.setBody('A monthly journey plan has been submitted for approval.');`	Calls the named method: notice.setBody('A monthly journey plan has been submitted for approval.');. Its implementation defines the side effect/result; use the symbol/file index to follow it.

170	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
171	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

force-app/main/default/classes/PjpPlannerController.cls-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

5 numbered source lines | SHA-256 991f1ca647a6d030b8f1828ad18737c5e94ecbe63a944a972fd685c6ab98f84a

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<ApexClass xmlns="http://soap.sforce.com/2006/04/metadata">`	Opens the ApexClass block; child elements specify its configuration.
3	`    <apiVersion>65.0</apiVersion>`	Sets Salesforce API version used for this component to 65.0.
4	`    <status>Active</status>`	Sets component activation status to Active.
5	`</ApexClass>`	Closes the ApexClass configuration block.

force-app/main/default/classes/PjpPlannerControllerTest.cls

Regression tests for PjpPlannerController. Fixture setup creates inputs, the action invokes behavior, and assertions compare actual results to expected outcomes. Tests with stubs do not verify the real mail provider or Salesforce transport.

84 numbered source lines | SHA-256 de2d755c29b9babdceece45d6c6ea0897f87288bcc8d3a9708daabbf55810bd3

force-app/main/default/classes/PjpPlannerControllerTest.cls-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

5 numbered source lines | SHA-256 991f1ca647a6d030b8f1828ad18737c5e94ecbe63a944a972fd685c6ab98f84a

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<ApexClass xmlns="http://soap.sforce.com/2006/04/metadata">`	Opens the ApexClass block; child elements specify its configuration.
3	`    <apiVersion>65.0</apiVersion>`	Sets Salesforce API version used for this component to 65.0.
4	`    <status>Active</status>`	Sets component activation status to Active.
5	`</ApexClass>`	Closes the ApexClass configuration block.

force-app/main/default/classes/SfaAllocationEmployeeService.cls

Resolves an allocation’s legacy sales representative to Salesforce User and then Employee, without overwriting an already populated employee lookup.

53 numbered source lines | SHA-256 169e43cecb9780e2b2c5c2f3b0ac6b213bbffbe49f9b86c49865532d324601eb

Line	Source code	Explanation / reading note
1	`public with sharing class SfaAllocationEmployeeService {`	Declares a class/type: public with sharing class SfaAllocationEmployeeService {. Uses record sharing, which does not alone enforce field/object permissions.
2	`    /**`	Developer comment/documentation: It is not executed.
3	`     * Links an outlet allocation to the Employee that uses the same Salesforce`	Developer comment/documentation: Links an outlet allocation to the Employee that uses the same Salesforce It is not executed.
4	`     * user as the selected Sales Representative.`	Developer comment/documentation: user as the selected Sales Representative. It is not executed.
5	`     */`	Developer comment/documentation: It is not executed.
6	`    public static void populateEmployee(List<Distributor_Outlet_Allocation__c> allocations) {`	Declares a callable function/method: public static void populateEmployee(List<Distributor_Outlet_Allocation__c> allocations) {. Parameters supply its inputs; the following block implements the operation.
7	`        Set<Id> representativeIds = new Set<Id>();`	Declares/initializes local data used by the surrounding operation: Set<Id> representativeIds = new Set<Id>();. Collection contents and assignments below determine its purpose.
8	`        for (Distributor_Outlet_Allocation__c allocation : allocations) {`	Repeats work over the specified records/items or while this condition holds: for (Distributor_Outlet_Allocation__c allocation : allocations) {. Check where queries/writes occur relative to the loop.
9	`            if (allocation.Distributor__c != null) {`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (allocation.Distributor__c != null) {.
10	`                representativeIds.add(allocation.Distributor__c);`	Calls the named method: representativeIds.add(allocation.Distributor__c);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
11	`            }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
12	`        }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
13		Blank line separating logical sections; no executable operation.

Line	Source code	Explanation / reading note
14	`if (representativeIds.isEmpty()) {`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (representativeIds.isEmpty()) {.
15	`return;`	Returns to the caller (or begins returned UI markup) and ends this execution path.
16	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
17		Blank line separating logical sections; no executable operation.
18	`Map<Id, Id> representativeToUser = new Map<Id, Id>();`	Declares/initializes local data used by the surrounding operation: Map<Id, Id> representativeToUser = new Map<Id, Id>();. Collection contents and assignments below determine its purpose.
19	`Set<Id> userIds = new Set<Id>();`	Declares/initializes local data used by the surrounding operation: Set<Id> userIds = new Set<Id>();. Collection contents and assignments below determine its purpose.
20	`for (Distributor__c representative : [`	Repeats work over the specified records/items or while this condition holds: for (Distributor__c representative : [. Check where queries/writes occur relative to the loop.
21	`SELECT Id, User__c`	Selects these Salesforce fields/aggregates: Id, User__c. Query results are used in the surrounding assignment or loop.
22	`FROM Distributor__c`	Chooses the Salesforce object/subquery source: FROM Distributor__c.
23	`WHERE Id IN :representativeIds`	Adds a query/filter condition: WHERE Id IN :representativeIds. The complete condition determines which records are included.
24	`]) {`	Continues the surrounding declaration/expression or text:]) {. Read it with the preceding opening statement (WHERE Id IN :representativeIds); it is not a standalone business operation.
25	`representativeToUser.put(representative.Id, representative.User__c);`	Calls the named method: representativeToUser.put(representative.Id, representative.User__c);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
26	`if (representative.User__c != null) {`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (representative.User__c != null) {.
27	`userIds.add(representative.User__c);`	Calls the named method: userIds.add(representative.User__c);. Its implementation defines the side effect/result; use the symbol/file index to follow it.

force-app/main/default/classes/SfaDemoDataFactory.cls-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

5 numbered source lines | SHA-256 991f1ca647a6d030b8f1828ad18737c5e94ecbe63a944a972fd685c6ab98f84a

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<ApexClass xmlns="http://soap.sforce.com/2006/04/metadata">`	Opens the ApexClass block; child elements specify its configuration.
3	`    <apiVersion>65.0</apiVersion>`	Sets Salesforce API version used for this component to 65.0.
4	`    <status>Active</status>`	Sets component activation status to Active.
5	`</ApexClass>`	Closes the ApexClass configuration block.

force-app/main/default/classes/SfaEmployeeInvitationService.cls

Sends application links when an employee is created or its access email changes. This is an invitation, not the DMS OTP sender. URL is currently localhost.

85 numbered source lines | SHA-256 cdc53785cffc086b0b9a351ad78ffc0705b8a05d00b4c9ff84ef45ef0b7f6475

Line	Source code	Explanation / reading note
1	`public with sharing class SfaEmployeeInvitationService {`	Declares a class/type: public with sharing class SfaEmployeeInvitationService {. Uses record sharing, which does not alone enforce field/object permissions.
2	`    @TestVisible`	Allows tests to inspect this otherwise private member without making it a public application API.
3	`    private static final String APPLICATION_URL = 'http://localhost:8081/';`	Assigns the right-hand expression to the named variable/property: private static final String APPLICATION_URL = 'http://localhost:8081/';. This is in-memory unless it is later persisted by an explicit call.
4		Blank line separating logical sections; no executable operation.
5	`    public static void emailApplicationLinks(`	Declares a callable function/method: public static void emailApplicationLinks(. Parameters supply its inputs; the following block implements the operation.
6	`        List<Employee__c> employees,`	Declares/initializes local data used by the surrounding operation: List<Employee__c> employees,. Collection contents and assignments below determine its purpose.
7	`        Map<Id, Employee__c> previousRecords`	Declares/initializes local data used by the surrounding operation: Map<Id, Employee__c> previousRecords. Collection contents and assignments below determine its purpose.
8	`    ) {`	Continues the surrounding declaration/expression or text:) {. Read it with the preceding opening statement (Map<Id, Employee__c> previousRecords); it is not a standalone business operation.
9	`        List<Messaging.SingleEmailMessage> messages = new List<Messaging.SingleEmailMessage>();`	Declares/initializes local data used by the surrounding operation: List<Messaging.SingleEmailMessage> messages = new List<Messaging.SingleEmailMessage>();. Collection contents and assignments below determine its purpose.
10		Blank line separating logical sections; no executable operation.
11	`        for (Employee__c employee : employees) {`	Repeats work over the specified records/items or while this condition holds: for (Employee__c employee : employees) {. Check where queries/writes occur relative to the loop.

Line	Source code	Explanation / reading note
12	`String accessEmail = String.isNotBlank(employee.Application_Access_Email__c)`	Declares/initializes local data used by the surrounding operation: String accessEmail = String.isNotBlank(employee.Application_Access_Email__c). Collection contents and assignments below determine its purpose.
13	`? employee.Application_Access_Email__c`	Continues the surrounding declaration/expression or text: ? employee.Application_Access_Email__c. Read it with the preceding opening statement (String accessEmail = String.isNotBlank(employee.Application_Access_Email__c)); it is not a standalone business operation.
14	`: employee.Email__c;`	Continues the surrounding declaration/expression or text: : employee.Email__c;. Read it with the preceding opening statement (? employee.Application_Access_Email__c); it is not a standalone business operation.
15	`if (String.isBlank(accessEmail)) {`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (String.isBlank(accessEmail)) {.
16	`continue;`	Skips the remainder of the current loop iteration and moves to the next item.
17	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
18		Blank line separating logical sections; no executable operation.
19	`Employee__c previousRecord = previousRecords == null`	Assigns the right-hand expression to the named variable/property: Employee__c previousRecord = previousRecords == null. This is in-memory unless it is later persisted by an explicit call.
20	`? null`	Continues the surrounding declaration/expression or text: ? null. Read it with the preceding opening statement (Employee__c previousRecord = previousRecords == null); it is not a standalone business operation.
21	`: previousRecords.get(employee.Id);`	Calls the named method: : previousRecords.get(employee.Id);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
22	`Boolean isNewEmployee = previousRecord == null;`	Declares/initializes local data used by the surrounding operation: Boolean isNewEmployee = previousRecord == null;. Collection contents and assignments below determine its purpose.
23	`Boolean emailChanged =`	Declares/initializes local data used by the surrounding operation: Boolean emailChanged =. Collection contents and assignments below determine its purpose.

Line	Source code	Explanation / reading note
24	`previousRecord != null &&`	Continues the surrounding declaration/expression or text: previousRecord != null &&. Read it with the preceding opening statement (Boolean emailChanged =); it is not a standalone business operation.

85	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

force-app/main/default/classes/SfaEmployeeInvitationService.cls-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

5 numbered source lines | SHA-256 a242f6e22b472afffbd726be71165de394e417355cdf1edd81b5601278ddea32

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<ApexClass xmlns="http://soap.sforce.com/2006/04/metadata">`	Opens the ApexClass block; child elements specify its configuration.
3	`    <apiVersion>67.0</apiVersion>`	Sets Salesforce API version used for this component to 67.0.
4	`    <status>Active</status>`	Sets component activation status to Active.
5	`</ApexClass>`	Closes the ApexClass configuration block.

force-app/main/default/classes/SfaEmployeeInvitationServiceTest.cls

Regression tests for SfaEmployeeInvitationService. Fixture setup creates inputs, the action invokes behavior, and assertions compare actual results to expected outcomes. Tests with stubs do not verify the real mail provider or Salesforce transport.

64 numbered source lines | SHA-256 283541f387fc1cfb659a39473e5b4863497687775ae3b43897d57dd3e156a48e

361	`'December'`	Continues the surrounding declaration/expression or text: 'December'. Read it with the preceding opening statement ('November',); it is not a standalone business operation.
362	`}[monthNumber - 1];`	Continues the surrounding declaration/expression or text: }[monthNumber - 1];. Read it with the preceding opening statement ('December'); it is not a standalone business operation.
363	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
364		Blank line separating logical sections; no executable operation.
365	`private static String approvedOutletNames(List<PJP_Selected_Beat__c> selectedBeats) {`	Declares a callable function/method: private static String approvedOutletNames(List<PJP_Selected_Beat__c> selectedBeats) {. Parameters supply its inputs; the following block implements the operation.

Line	Source code	Explanation / reading note
366	`        Set<Id> beatIds = new Set<Id>();`	Declares/initializes local data used by the surrounding operation: Set<Id> beatIds = new Set<Id>();. Collection contents and assignments below determine its purpose.
367	`        for (PJP_Selected_Beat__c selection : selectedBeats) {`	Repeats work over the specified records/items or while this condition holds: for (PJP_Selected_Beat__c selection : selectedBeats) {. Check where queries/writes occur relative to the loop.
368	`            if (selection.Beat__c != null)`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (selection.Beat__c != null).
369	`                beatIds.add(selection.Beat__c);`	Calls the named method: beatIds.add(selection.Beat__c);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
370	`        }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
371	`        if (beatIds.isEmpty())`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (beatIds.isEmpty()).
372	`            return null;`	Returns null to the caller (or begins returned UI markup) and ends this execution path.
373		Blank line separating logical sections; no executable operation.
374	`        List<String> outletNames = new List<String>();`	Declares/initializes local data used by the surrounding operation: List<String> outletNames = new List<String>();. Collection contents and assignments below determine its purpose.
375	`        for (Retailer__c outlet : [`	Repeats work over the specified records/items or while this condition holds: for (Retailer__c outlet : [. Check where queries/writes occur relative to the loop.
376	`            SELECT Name`	Selects these Salesforce fields/aggregates: Name. Query results are used in the surrounding assignment or loop.
377	`            FROM Retailer__c`	Chooses the Salesforce object/subquery source: FROM Retailer__c.
378	`            WHERE Beat__c IN :beatIds AND Active__c = TRUE`	Adds a query/filter condition: WHERE Beat__c IN :beatIds AND Active__c = TRUE. The complete condition determines which records are included.
379	`            ORDER BY Name`	Controls query sorting, grouping or result count: ORDER BY Name.
380	`        ]) {`	Continues the surrounding declaration/expression or text:]) {. Read it with the preceding opening statement (ORDER BY Name); it is not a standalone business operation.

Line	Source code	Explanation / reading note
381	`outletNames.add(outlet.Name);`	Calls the named method: outletNames.add(outlet.Name);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
382	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
383	`String joinedNames = String.join(outletNames, ', ');`	Declares/initializes local data used by the surrounding operation: String joinedNames = String.join(outletNames, ', ');. Collection contents and assignments below determine its purpose.
384	`return joinedNames.length() > 255 ? joinedNames.substring(0, 252) + '...' : joinedNames;`	Returns joinedNames.length() > 255 ? joinedNames.substring(0, 252) + '...' : joinedNames to the caller (or begins returned UI markup) and ends this execution path.
385	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
386	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

force-app/main/default/classes/SfaPhaseOnePjpController.cls-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

5 numbered source lines | SHA-256 bfb7de2eaac5ccd928c618e8c0abe32579acfa7321aac1bdff53945e52d84a41

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<ApexClass xmlns="http://soap.sforce.com/2006/04/metadata">`	Opens the ApexClass block; child elements specify its configuration.
3	`    <apiVersion>67.0</apiVersion>`	Sets Salesforce API version used for this component to 67.0.
4	`    <status>Active</status>`	Sets component activation status to Active.
5	`</ApexClass>`	Closes the ApexClass configuration block.

force-app/main/default/classes/SfaPhaseOnePjpControllerTest.cls

Regression tests for SfaPhaseOnePjpController. Fixture setup creates inputs, the action invokes behavior, and assertions compare actual results to expected outcomes. Tests with stubs do not verify the real mail provider or Salesforce transport.

179 numbered source lines | SHA-256 b50684c21b9ae9b4194c9fc91fb9653dc21ed3500425a568938c9efdac4d12fe

Line	Source code	Explanation / reading note
1	`@IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
2	`private class SfaPhaseOnePjpControllerTest {`	Declares a class/type: private class SfaPhaseOnePjpControllerTest {. Members below hold behavior and/or state.
3	`    private static User makeUser(String label) {`	Declares a callable function/method: private static User makeUser(String label) {. Parameters supply its inputs; the following block implements the operation.
4	`        Profile profile = [SELECT Id FROM Profile WHERE Id = :UserInfo.getProfileId()];`	Calls the named method: Profile profile = [SELECT Id FROM Profile WHERE Id = :UserInfo.getProfileId()];. Its implementation defines the side effect/result; use the symbol/file index to follow it.
5	`        String unique = label + '.' + System.now().getTime() + '@example.test';`	Declares/initializes local data used by the surrounding operation: String unique = label + '.' + System.now().getTime() + '@example.test';. Collection contents and assignments below determine its purpose.
6	`        return new User(`	Returns new User(to the caller (or begins returned UI markup) and ends this execution path.
7	`            FirstName = label,`	Assigns the right-hand expression to the named variable/property: FirstName = label,. This is in-memory unless it is later persisted by an explicit call.
8	`            LastName = 'SFA',`	Assigns the right-hand expression to the named variable/property: LastName = 'SFA',. This is in-memory unless it is later persisted by an explicit call.
9	`            Alias = label.left(5),`	Calls the named method: Alias = label.left(5),. Its implementation defines the side effect/result; use the symbol/file index to follow it.
10	`            Email = unique,`	Assigns the right-hand expression to the named variable/property: Email = unique,. This is in-memory unless it is later persisted by an explicit call.
11	`            Username = unique,`	Assigns the right-hand expression to the named variable/property: Username = unique,. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
12	`CommunityNickname = label + System.now().getTime(),`	Calls the named method: CommunityNickname = label + System.now().getTime(),. Its implementation defines the side effect/result; use the symbol/file index to follow it.
13	`TimeZoneSidKey = 'Asia/Kolkata',`	Assigns the right-hand expression to the named variable/property: TimeZoneSidKey = 'Asia/Kolkata',. This is in-memory unless it is later persisted by an explicit call.
14	`LocaleSidKey = 'en_IN',`	Assigns the right-hand expression to the named variable/property: LocaleSidKey = 'en_IN',. This is in-memory unless it is later persisted by an explicit call.
15	`EmailEncodingKey = 'UTF-8',`	Assigns the right-hand expression to the named variable/property: EmailEncodingKey = 'UTF-8',. This is in-memory unless it is later persisted by an explicit call.
16	`LanguageLocaleKey = 'en_US',`	Assigns the right-hand expression to the named variable/property: LanguageLocaleKey = 'en_US',. This is in-memory unless it is later persisted by an explicit call.
17	`ProfileId = profile.Id`	Assigns the right-hand expression to the named variable/property: ProfileId = profile.Id. This is in-memory unless it is later persisted by an explicit call.
18	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
19	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
20		Blank line separating logical sections; no executable operation.

120	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

Line	Source code	Explanation / reading note
121	`        Permanent_Journey_Plan__c approved = [`	Assigns the right-hand expression to the named variable/property: Permanent_Journey_Plan__c approved = [. This is in-memory unless it is later persisted by an explicit call.
122	`            SELECT Status__c, Approved_By__c, Approved_Date__c`	Selects these Salesforce fields/aggregates: Status__c, Approved_By__c, Approved_Date__c. Query results are used in the surrounding assignment or loop.
123	`            FROM Permanent_Journey_Plan__c`	Chooses the Salesforce object/subquery source: FROM Permanent_Journey_Plan__c.
124	`            WHERE Id = :pjpId`	Adds a query/filter condition: WHERE Id = :pjpId. The complete condition determines which records are included.
125	`        ];`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
126	`        System.assertEquals('Approved', approved.Status__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals('Approved', approved.Status__c);. A mismatch fails the test.
127	`        System.assertEquals(managerUser.Id, approved.Approved_By__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertEquals(managerUser.Id, approved.Approved_By__c);. A mismatch fails the test.
128	`        System.assertNotEquals(null, approved.Approved_Date__c);`	Test assertion comparing an expected outcome to actual behavior: System.assertNotEquals(null, approved.Approved_Date__c);. A mismatch fails the test.
129	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
130		Blank line separating logical sections; no executable operation.
131	`    @IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
132	`    static void rejectsInvalidDateRange() {`	Continues the surrounding declaration/expression or text: static void rejectsInvalidDateRange() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.
133	`        User employeeUser = makeUser('Aish');`	Assigns the right-hand expression to the named variable/property: User employeeUser = makeUser('Aish');. This is in-memory unless it is later persisted by an explicit call.
134	`        insert employeeUser;`	Performs Salesforce DML: insert employeeUser;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.

Line	Source code	Explanation / reading note
135	`assignSfaAccess(new List<User>{ employeeUser });`	Continues the surrounding declaration/expression or text: assignSfaAccess(new List<User>{ employeeUser });. Read it with the preceding opening statement (insert employeeUser;); it is not a standalone business operation.
136	`System.runAs(employeeUser) {`	Calls the named method: System.runAs(employeeUser) {. Its implementation defines the side effect/result; use the symbol/file index to follow it.
137	`Geography__c geography = new Geography__c(`	Assigns the right-hand expression to the named variable/property: Geography__c geography = new Geography__c(. This is in-memory unless it is later persisted by an explicit call.
138	`Name = 'Test Geo',`	Assigns the right-hand expression to the named variable/property: Name = 'Test Geo',. This is in-memory unless it is later persisted by an explicit call.
139	`Nation__c = 'India',`	Assigns the right-hand expression to the named variable/property: Nation__c = 'India',. This is in-memory unless it is later persisted by an explicit call.
140	`State__c = 'Karnataka',`	Assigns the right-hand expression to the named variable/property: State__c = 'Karnataka',. This is in-memory unless it is later persisted by an explicit call.
141	`District__c = 'Bengaluru Urban',`	Assigns the right-hand expression to the named variable/property: District__c = 'Bengaluru Urban',. This is in-memory unless it is later persisted by an explicit call.
142	`Town__c = 'MG Road'`	Assigns the right-hand expression to the named variable/property: Town__c = 'MG Road'. This is in-memory unless it is later persisted by an explicit call.
143	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
144	`insert geography;`	Performs Salesforce DML: insert geography;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
145	`Employee__c manager = new Employee__c(`	Assigns the right-hand expression to the named variable/property: Employee__c manager = new Employee__c(. This is in-memory unless it is later persisted by an explicit call.
146	`Name = 'Manager',`	Assigns the right-hand expression to the named variable/property: Name = 'Manager',. This is in-memory unless it is later persisted by an explicit call.
147	`Phone__c = '9000000201',`	Assigns the right-hand expression to the named variable/property: Phone__c = '9000000201',. This is in-memory unless it is later persisted by an explicit call.
148	`Active__c = true,`	Assigns the right-hand expression to the named variable/property: Active__c = true,. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
149	`Geography__c = geography.Id`	Assigns the right-hand expression to the named variable/property: Geography__c = geography.Id. This is in-memory unless it is later persisted by an explicit call.
150	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
151	`Database.insert(manager, AccessLevel.SYSTEM_MODE);`	Specifies database execution/access mode explicitly. System mode needs deliberate business authorization; user mode enforces user access restrictions.
152	`Database.insert(`	Performs Salesforce DML: Database.insert(. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
153	`new Employee__c(`	Continues the surrounding declaration/expression or text: new Employee__c(. Read it with the preceding opening statement (Database.insert(); it is not a standalone business operation.
154	`Name = 'Aishwarya',`	Assigns the right-hand expression to the named variable/property: Name = 'Aishwarya',. This is in-memory unless it is later persisted by an explicit call.
155	`Phone__c = '9000000202',`	Assigns the right-hand expression to the named variable/property: Phone__c = '9000000202',. This is in-memory unless it is later persisted by an explicit call.
156	`Active__c = true,`	Assigns the right-hand expression to the named variable/property: Active__c = true,. This is in-memory unless it is later persisted by an explicit call.
157	`Geography__c = geography.Id,`	Assigns the right-hand expression to the named variable/property: Geography__c = geography.Id,. This is in-memory unless it is later persisted by an explicit call.
158	`Salesforce_User__c = employeeUser.Id,`	Assigns the right-hand expression to the named variable/property: Salesforce_User__c = employeeUser.Id,. This is in-memory unless it is later persisted by an explicit call.
159	`Reporting_Manager__c = manager.Id`	Assigns the right-hand expression to the named variable/property: Reporting_Manager__c = manager.Id. This is in-memory unless it is later persisted by an explicit call.
160	`),`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

force-app/main/default/classes/SfaPjpAllocationService.cls-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

2 numbered source lines | SHA-256 17e31f2473b0c9f7048b434edab7d12261a9b8a0b9ede833cb9c3141eeeccb7b

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<ApexClass xmlns="http://soap.sforce.com/2006/04/metadata"><apiVersion>67.0</apiVersion><status>Active</status></ApexClass>`	Sets Apex Class in the enclosing configuration to <apiVersion>67.0</apiVersion><status>Active</status>.

force-app/main/default/classes/SfaPjpAllocationServiceTest.cls

Regression tests for SfaPjpAllocationService. Fixture setup creates inputs, the action invokes behavior, and assertions compare actual results to expected outcomes. Tests with stubs do not verify the real mail provider or Salesforce transport.

175 numbered source lines | SHA-256 755d5eb8bbfa71969284c53867605010229f06c62227c0cc00ce9157f2e9f18c

27	`insert beat;`	Performs Salesforce DML: insert beat;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
28	`Retailer__c outlet = new Retailer__c(`	Assigns the right-hand expression to the named variable/property: Retailer__c outlet = new Retailer__c(. This is in-memory unless it is later persisted by an explicit call.
29	`Name = 'Nandi Daily Mart',`	Assigns the right-hand expression to the named variable/property: Name = 'Nandi Daily Mart',. This is in-memory unless it is later persisted by an explicit call.
30	`Address__c = '12 Lake View Road, Bengaluru',`	Assigns the right-hand expression to the named variable/property: Address__c = '12 Lake View Road, Bengaluru',. This is in-memory unless it is later persisted by an explicit call.
31	`Beat__c = beat.Id,`	Assigns the right-hand expression to the named variable/property: Beat__c = beat.Id,. This is in-memory unless it is later persisted by an explicit call.
32	`Active__c = true`	Assigns the right-hand expression to the named variable/property: Active__c = true. This is in-memory unless it is later persisted by an explicit call.
33	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
34	`insert outlet;`	Performs Salesforce DML: insert outlet;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
35	`Product__c product = new Product__c(`	Assigns the right-hand expression to the named variable/property: Product__c product = new Product__c(. This is in-memory unless it is later persisted by an explicit call.
36	`Name = 'Sunrise Millet Bites',`	Assigns the right-hand expression to the named variable/property: Name = 'Sunrise Millet Bites',. This is in-memory unless it is later persisted by an explicit call.
37	`Product_Code__c = 'SMB-100',`	Assigns the right-hand expression to the named variable/property: Product_Code__c = 'SMB-100',. This is in-memory unless it is later persisted by an explicit call.
38	`Active__c = true,`	Assigns the right-hand expression to the named variable/property: Active__c = true,. This is in-memory unless it is later persisted by an explicit call.
39	`Available_Stock__c = 100,`	Assigns the right-hand expression to the named variable/property: Available_Stock__c = 100,. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
40	`Units_Per_Case__c = 20,`	Assigns the right-hand expression to the named variable/property: Units_Per_Case__c = 20,. This is in-memory unless it is later persisted by an explicit call.
41	`MRP__c = 22,`	Assigns the right-hand expression to the named variable/property: MRP__c = 22,. This is in-memory unless it is later persisted by an explicit call.
42	`Retailer_Base_Price__c = 18`	Assigns the right-hand expression to the named variable/property: Retailer_Base_Price__c = 18. This is in-memory unless it is later persisted by an explicit call.
43	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
44	`insert product;`	Performs Salesforce DML: insert product;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
45	`Permanent_Journey_Plan__c plan = new Permanent_Journey_Plan__c(`	Assigns the right-hand expression to the named variable/property: Permanent_Journey_Plan__c plan = new Permanent_Journey_Plan__c(. This is in-memory unless it is later persisted by an explicit call.
46	`Name = 'Creative Demo Plan',`	Assigns the right-hand expression to the named variable/property: Name = 'Creative Demo Plan',. This is in-memory unless it is later persisted by an explicit call.
47	`Beat__c = beat.Id,`	Assigns the right-hand expression to the named variable/property: Beat__c = beat.Id,. This is in-memory unless it is later persisted by an explicit call.
48	`Planned_Date__c = Date.today(),`	Calls the named method: Planned_Date__c = Date.today(),. Its implementation defines the side effect/result; use the symbol/file index to follow it.
49	`Status__c = 'Approved'`	Assigns the right-hand expression to the named variable/property: Status__c = 'Approved'. This is in-memory unless it is later persisted by an explicit call.
50	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
51	`insert plan;`	Performs Salesforce DML: insert plan;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
52	`Visit__c visit = new Visit__c(`	Assigns the right-hand expression to the named variable/property: Visit__c visit = new Visit__c(. This is in-memory unless it is later persisted by an explicit call.
53	`Name = 'Nandi Daily Mart Visit',`	Assigns the right-hand expression to the named variable/property: Name = 'Nandi Daily Mart Visit',. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
54	`            Retailer__c = outlet.Id,`	Assigns the right-hand expression to the named variable/property: Retailer__c = outlet.Id,. This is in-memory unless it is later persisted by an explicit call.
55	`            Permanent_Journey_Plan__c = plan.Id,`	Assigns the right-hand expression to the named variable/property: Permanent_Journey_Plan__c = plan.Id,. This is in-memory unless it is later persisted by an explicit call.
56	`            Visit_Date__c = Date.today(),`	Calls the named method: Visit_Date__c = Date.today(),. Its implementation defines the side effect/result; use the symbol/file index to follow it.
57	`            Status__c = 'Checked In'`	Assigns the right-hand expression to the named variable/property: Status__c = 'Checked In'. This is in-memory unless it is later persisted by an explicit call.
58	`        );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
59	`        insert visit;`	Performs Salesforce DML: insert visit;. It can invoke triggers/validation and fail; collection operations avoid one DML call per record.
60	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
61		Blank line separating logical sections; no executable operation.
62	`    @IsTest`	Marks test code; it verifies behavior with isolated test data rather than serving normal application requests.
63	`    static void savesEveryVisitAction() {`	Continues the surrounding declaration/expression or text: static void savesEveryVisitAction() {. Read it with the preceding opening statement (@IsTest); it is not a standalone business operation.
64	`        Visit__c visit = [SELECT Id FROM Visit__c LIMIT 1];`	Assigns the right-hand expression to the named variable/property: Visit__c visit = [SELECT Id FROM Visit__c LIMIT 1];. This is in-memory unless it is later persisted by an explicit call.
65	`        Product__c product = [SELECT Id FROM Product__c LIMIT 1];`	Assigns the right-hand expression to the named variable/property: Product__c product = [SELECT Id FROM Product__c LIMIT 1];. This is in-memory unless it is later persisted by an explicit call.
66	`        Map<String, Object> common = new Map<String, Object>{`	Declares/initializes local data used by the surrounding operation: Map<String, Object> common = new Map<String, Object>{. Collection contents and assignments below determine its purpose.

Line	Source code	Explanation / reading note
67	`'dateValue' => String.valueOf(Date.today()),`	Calls the named method: 'dateValue' => String.valueOf(Date.today()),. Its implementation defines the side effect/result; use the symbol/file index to follow it.
68	`'imageUrl' => 'https://example.com/evidence.jpg'`	Continues the surrounding declaration/expression or text: 'imageUrl' => 'https://example.com/evidence.jpg'. Read it with the preceding opening statement ('dateValue' => String.valueOf(Date.today()),); it is not a standalone business operation.
69	`};`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
70	`common.put('assetName', 'Chiller');`	Calls the named method: common.put('assetName', 'Chiller');. Its implementation defines the side effect/result; use the symbol/file index to follow it.
71	`common.put('assetCode', 'CH-101');`	Calls the named method: common.put('assetCode', 'CH-101');. Its implementation defines the side effect/result; use the symbol/file index to follow it.
72	`common.put('status', 'Working');`	Calls the named method: common.put('status', 'Working');. Its implementation defines the side effect/result; use the symbol/file index to follow it.
73	`Test.startTest();`	Starts the isolated Apex test execution window and resets the relevant governor-limit counters.
74	`System.assertNotEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertNotEquals(. A mismatch fails the test.
75	`null,`	Continues the surrounding declaration/expression or text: null,. Read it with the preceding opening statement (System.assertNotEquals(); it is not a standalone business operation.
76	`SfaVisitActionsController.saveVisitAction('asset', visit.Id, JSON.serialize(common))`	Converts structured data to JSON for HTTP, persistent storage or a fingerprint.
77	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
78	`System.assertNotEquals(`	Test assertion comparing an expected outcome to actual behavior: System.assertNotEquals(. A mismatch fails the test.
79	`null,`	Continues the surrounding declaration/expression or text: null,. Read it with the preceding opening statement (System.assertNotEquals(); it is not a standalone business operation.
80	`SfaVisitActionsController.saveVisitAction(`	Calls the named method: SfaVisitActionsController.saveVisitAction(. Its implementation defines the side effect/result; use the symbol/file index to follow it.

Line	Source code	Explanation / reading note
81	`'competitor',`	Continues the surrounding declaration/expression or text: 'competitor',. Read it with the preceding opening statement (SfaVisitActionsController.saveVisitAction(); it is not a standalone business operation.
82	`visit.Id,`	Continues the surrounding declaration/expression or text: visit.Id,. Read it with the preceding opening statement ('competitor',); it is not a standalone business operation.
83	`'{"competitorName":"Fresh Foods","company":"Fresh Foods Ltd","mrp":30,"rbp":25,"schemeDetails":"Buy 5 get 1"}'`	Continues the surrounding declaration/expression or text: '{"competitorName":"Fresh Foods","company":"Fresh Foods Ltd","mrp":30,"rbp":25,"schemeDetails":"Buy 5 get 1"}'. Read it with the preceding opening statement (visit.Id,); it is not a standalone business operation.
84	`)`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
85	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
86	`String productPayload = JSON.serialize(`	Converts structured data to JSON for HTTP, persistent storage or a fingerprint.
87	`new Map<String, Object>{`	Continues the surrounding declaration/expression or text: new Map<String, Object>{. Read it with the preceding opening statement (String productPayload = JSON.serialize(); it is not a standalone business operation.
88	`'productId' => product.Id,`	Continues the surrounding declaration/expression or text: 'productId' => product.Id,. Read it with the preceding opening statement (new Map<String, Object>{); it is not a standalone business operation.
89	`'quantity' => 8,`	Continues the surrounding declaration/expression or text: 'quantity' => 8,. Read it with the preceding opening statement ('productId' => product.Id,); it is not a standalone business operation.
90	`'dateValue' => String.valueOf(Date.today())`	Calls the named method: 'dateValue' => String.valueOf(Date.today()). Its implementation defines the side effect/result; use the symbol/file index to follow it.
91	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
92	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

50	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
51		Blank line separating logical sections; no executable operation.
52	`  handleSelectionChange(event) {`	Continues the surrounding declaration/expression or text: handleSelectionChange(event) {. Read it with the preceding opening statement; it is not a standalone business operation.
53	`    const values = event.detail.value;`	Declares/initializes local data used by the surrounding operation: const values = event.detail.value;. Collection contents and assignments below determine its purpose.
54	`    if (values.length > 10) {`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (values.length > 10) {.
55	`      this.showToast("Maximum reached", "Select no more than 10 outlets.", "warning");`	Calls the named method: this.showToast("Maximum reached", "Select no more than 10 outlets.", "warning");. Its implementation defines the side effect/result; use the symbol/file index to follow it.
56	`      return;`	Returns to the caller (or begins returned UI markup) and ends this execution path.
57	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

Line	Source code	Explanation / reading note
58	`    this.selectedOutletIds = [...values];`	Assigns the right-hand expression to the named variable/property: this.selectedOutletIds = [...values];. This is in-memory unless it is later persisted by an explicit call.
59	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
60		Blank line separating logical sections; no executable operation.
61	`  async saveOutlets() {`	Continues the surrounding declaration/expression or text: async saveOutlets() {. Read it with the preceding opening statement; it is not a standalone business operation.
62	`    if (this.selectedOutletIds.length > 10) {`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (this.selectedOutletIds.length > 10) {.
63	`      this.showToast("Maximum reached", "Select no more than 10 outlets.", "warning");`	Calls the named method: this.showToast("Maximum reached", "Select no more than 10 outlets.", "warning");. Its implementation defines the side effect/result; use the symbol/file index to follow it.
64	`      return;`	Returns to the caller (or begins returned UI markup) and ends this execution path.
65	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
66		Blank line separating logical sections; no executable operation.
67	`    this.isLoading = true;`	Assigns the right-hand expression to the named variable/property: this.isLoading = true;. This is in-memory unless it is later persisted by an explicit call.
68	`    try {`	Starts operations whose failure is handled by the following catch/finally blocks.
69	`      const count = await saveSelection({`	Waits for this asynchronous operation before continuing: const count = await saveSelection({. The returned result/error must still be handled.
70	`        beatId: this.recordId,`	Sets/declares the named object property or style/type member: beatId: this.recordId,. Interpret it in the enclosing object, props or type definition.
71	`        selectedOutletIds: this.selectedOutletIds,`	Sets/declares the named object property or style/type member: selectedOutletIds: this.selectedOutletIds,. Interpret it in the enclosing object, props or type definition.
72	`      });`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

Line	Source code	Explanation / reading note
73	`      await notifyRecordUpdateAvailable([{ recordId: this.recordId }]);`	Waits for this asynchronous operation before continuing: await notifyRecordUpdateAvailable([{ recordId: this.recordId }]);. The returned result/error must still be handled.
74	`      this.showToast("Outlets saved", `${count} outlets are assigned to this Beat.`, "success");`	Calls the named method: this.showToast("Outlets saved", `${count} outlets are assigned to this Beat.`, "success");. Its implementation defines the side effect/result; use the symbol/file index to follow it.
75	`      this.dispatchEvent(new CloseActionScreenEvent());`	Calls the named method: this.dispatchEvent(new CloseActionScreenEvent());. Its implementation defines the side effect/result; use the symbol/file index to follow it.
76	`    } catch (error) {`	Handles an exception from the preceding try block. Check whether it rolls back, preserves queued work or only displays an error.
77	`      this.showToast("Unable to save outlets", this.messageFrom(error), "error");`	Calls the named method: this.showToast("Unable to save outlets", this.messageFrom(error), "error");. Its implementation defines the side effect/result; use the symbol/file index to follow it.
78	`    } finally {`	Cleanup section that runs after success or failure, for example clearing a timer or busy flag.
79	`      this.isLoading = false;`	Assigns the right-hand expression to the named variable/property: this.isLoading = false;. This is in-memory unless it is later persisted by an explicit call.
80	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
81	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
82		Blank line separating logical sections; no executable operation.

21	`  connectedCallback() {`	Continues the surrounding declaration/expression or text: connectedCallback() {. Read it with the preceding opening statement (draftId;); it is not a standalone business operation.
22	`    this.initialise();`	Calls the named method: this.initialise();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
23	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

Line	Source code	Explanation / reading note
24	`  async initialise() {`	Continues the surrounding declaration/expression or text: async initialise() {. Read it with the preceding opening statement (}); it is not a standalone business operation.
25	`    try {`	Starts operations whose failure is handled by the following catch/finally blocks.
26	`      [this.context, this.beats] = await Promise.all([getMyContext(), getMyBeats()]);`	Starts independent asynchronous operations together and waits for all; rejection propagates to the surrounding error handler.
27	`      this.setDefaultDates();`	Calls the named method: this.setDefaultDates();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
28	`      await this.refreshLists();`	Waits for this asynchronous operation before continuing: await this.refreshLists();. The returned result/error must still be handled.
29	`    } catch (error) {`	Handles an exception from the preceding try block. Check whether it rolls back, preserves queued work or only displays an error.
30	`      this.showError(error);`	Calls the named method: this.showError(error);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
31	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
32	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
33	`  get beatOptions() {`	Continues the surrounding declaration/expression or text: get beatOptions() {. Read it with the preceding opening statement (}); it is not a standalone business operation.
34	`    return this.beats.map((beat) => ({`	Returns this.beats.map((beat) => ({ to the caller (or begins returned UI markup) and ends this execution path.
35	`      label: beat.Geography__r?.Name ? `${beat.Name} — ${beat.Geography__r.Name}` : beat.Name,`	Sets/declares the named object property or style/type member: label: beat.Geography__r?.Name ? `${beat.Name} - ${beat.Geography__r.Name}` : beat.Name,. Interpret it in the enclosing object, props or type definition.
36	`      value: beat.Id,`	Sets/declares the named object property or style/type member: value: beat.Id,. Interpret it in the enclosing object, props or type definition.
37	`    }));`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

Line	Source code	Explanation / reading note
38	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
39	`  get hasMyPjps() {`	Continues the surrounding declaration/expression or text: get hasMyPjps() {. Read it with the preceding opening statement (}); it is not a standalone business operation.
40	`    return this.myPjps.length > 0;`	Returns this.myPjps.length > 0 to the caller (or begins returned UI markup) and ends this execution path.
41	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
42	`  get hasApprovals() {`	Continues the surrounding declaration/expression or text: get hasApprovals() {. Read it with the preceding opening statement (}); it is not a standalone business operation.
43	`    return this.approvals.length > 0;`	Returns this.approvals.length > 0 to the caller (or begins returned UI markup) and ends this execution path.
44	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
45	`  handleStart(event) {`	Continues the surrounding declaration/expression or text: handleStart(event) {. Read it with the preceding opening statement (}); it is not a standalone business operation.
46	`    this.startDate = event.target.value;`	Assigns the right-hand expression to the named variable/property: this.startDate = event.target.value;. This is in-memory unless it is later persisted by an explicit call.
47	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
48	`  handleEnd(event) {`	Continues the surrounding declaration/expression or text: handleEnd(event) {. Read it with the preceding opening statement (}); it is not a standalone business operation.
49	`    this.endDate = event.target.value;`	Assigns the right-hand expression to the named variable/property: this.endDate = event.target.value;. This is in-memory unless it is later persisted by an explicit call.
50	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
51	`  handleBeats(event) {`	Continues the surrounding declaration/expression or text: handleBeats(event) {. Read it with the preceding opening statement (}); it is not a standalone business operation.

Line	Source code	Explanation / reading note
52	`    this.selectedBeatIds = event.detail.value;`	Assigns the right-hand expression to the named variable/property: this.selectedBeatIds = event.detail.value;. This is in-memory unless it is later persisted by an explicit call.
53	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
54	`  handleReason(event) {`	Continues the surrounding declaration/expression or text: handleReason(event) {. Read it with the preceding opening statement (}); it is not a standalone business operation.
55	`    this.rejectionReasons = {`	Assigns the right-hand expression to the named variable/property: this.rejectionReasons = {. This is in-memory unless it is later persisted by an explicit call.
56	`      ...this.rejectionReasons,`	Continues the surrounding declaration/expression or text: ...this.rejectionReasons,. Read it with the preceding opening statement (this.rejectionReasons = {); it is not a standalone business operation.
57	`      [event.target.dataset.id]: event.target.value,`	Continues the surrounding declaration/expression or text: [event.target.dataset.id]: event.target.value,. Read it with the preceding opening statement (...this.rejectionReasons,); it is not a standalone business operation.
58	`    };`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
59	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
60	`  setDefaultDates() {`	Continues the surrounding declaration/expression or text: setDefaultDates() {. Read it with the preceding opening statement (}); it is not a standalone business operation.
61	`    const now = new Date();`	Declares/initializes local data used by the surrounding operation: const now = new Date();. Collection contents and assignments below determine its purpose.
62	`    const year = now.getFullYear();`	Declares/initializes local data used by the surrounding operation: const year = now.getFullYear();. Collection contents and assignments below determine its purpose.
63	`    const month = String(now.getMonth() + 1).padStart(2, "0");`	Declares/initializes local data used by the surrounding operation: const month = String(now.getMonth() + 1).padStart(2, "0");. Collection contents and assignments below determine its purpose.
64	`    const last = new Date(year, now.getMonth() + 1, 0).getDate();`	Declares/initializes local data used by the surrounding operation: const last = new Date(year, now.getMonth() + 1, 0).getDate();. Collection contents and assignments below determine its purpose.

Line	Source code	Explanation / reading note
65	`this.startDate = `${year}-${month}-01`;`	Assigns the right-hand expression to the named variable/property: this.startDate = `${year}-${month}-01`;. This is in-memory unless it is later persisted by an explicit call.
66	`this.endDate = `${year}-${month}-${String(last).padStart(2, "0")}`;`	Assigns the right-hand expression to the named variable/property: this.endDate = `${year}-${month}-${String(last).padStart(2, "0")}`;. This is in-memory unless it is later persisted by an explicit call.
67	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
68	`resetForm() {`	Continues the surrounding declaration/expression or text: resetForm() {. Read it with the preceding opening statement (}); it is not a standalone business operation.
69	`this.draftId = null;`	Assigns the right-hand expression to the named variable/property: this.draftId = null;. This is in-memory unless it is later persisted by an explicit call.
70	`this.selectedBeatIds = [];`	Assigns the right-hand expression to the named variable/property: this.selectedBeatIds = [];. This is in-memory unless it is later persisted by an explicit call.
71	`this.setDefaultDates();`	Calls the named method: this.setDefaultDates();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
72	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
73	`async saveDraft() {`	Continues the surrounding declaration/expression or text: async saveDraft() {. Read it with the preceding opening statement (}); it is not a standalone business operation.
74	`try {`	Starts operations whose failure is handled by the following catch/finally blocks.
75	`this.draftId = await savePjpDraft({`	Waits for this asynchronous operation before continuing: this.draftId = await savePjpDraft({. The returned result/error must still be handled.
76	`pjpId: this.draftId,`	Sets/declares the named object property or style/type member: pjpId: this.draftId,. Interpret it in the enclosing object, props or type definition.
77	`startDate: this.startDate,`	Sets/declares the named object property or style/type member: startDate: this.startDate,. Interpret it in the enclosing object, props or type definition.
78	`endDate: this.endDate,`	Sets/declares the named object property or style/type member: endDate: this.endDate,. Interpret it in the enclosing object, props or type definition.

Line	Source code	Explanation / reading note
79	`beatIds: this.selectedBeatIds,`	Sets/declares the named object property or style/type member: beatIds: this.selectedBeatIds,. Interpret it in the enclosing object, props or type definition.
80	`});`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
81	`this.toast("Draft saved", "The PJP and selected Beats were saved.", " success");`	Calls the named method: this.toast("Draft saved", "The PJP and selected Beats were saved.", "success");. Its implementation defines the side effect/result; use the symbol/file index to follow it.
82	`await this.refreshLists();`	Waits for this asynchronous operation before continuing: await this.refreshLists();. The returned result/error must still be handled.
83	`} catch (error) {`	Handles an exception from the preceding try block. Check whether it rolls back, preserves queued work or only displays an error.
84	`this.showError(error);`	Calls the named method: this.showError(error);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
85	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
86	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
87	`async submitForApproval() {`	Continues the surrounding declaration/expression or text: async submitForApproval() {. Read it with the preceding opening statement (}); it is not a standalone business operation.
88	`try {`	Starts operations whose failure is handled by the following catch/finally blocks.
89	`if (!this.draftId) await this.saveDraft();`	Waits for this asynchronous operation before continuing: if (!this.draftId) await this.saveDraft();. The returned result/error must still be handled.
90	`if (!this.draftId) return;`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!this.draftId) return;.
91	`await submitPjp({ pjpId: this.draftId });`	Waits for this asynchronous operation before continuing: await submitPjp({ pjpId: this.draftId });. The returned result/error must still be handled.
92	`this.toast("PJP submitted", `The PJP was sent to ${this.context.managerName}.`, "success");`	Calls the named method: this.toast("PJP submitted", `The PJP was sent to ${this.context.managerName}.`, "success");. Its implementation defines the side effect/result; use the symbol/file index to follow it.

Line	Source code	Explanation / reading note
93	`      this.resetForm();`	Calls the named method: this.resetForm();. Its implementation defines the side effect/result; use the symbol/file index to follow it.
94	`      await this.refreshLists();`	Waits for this asynchronous operation before continuing: await this.refreshLists();. The returned result/error must still be handled.
95	`    } catch (error) {`	Handles an exception from the preceding try block. Check whether it rolls back, preserves queued work or only displays an error.
96	`      this.showError(error);`	Calls the named method: this.showError(error);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
97	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
98	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
99	`  approve(event) {`	Continues the surrounding declaration/expression or text: approve(event) {. Read it with the preceding opening statement (}); it is not a standalone business operation.
100	`    this.decide(event.target.dataset.id, true);`	Calls the named method: this.decide(event.target.dataset.id, true);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
101	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
102	`  reject(event) {`	Continues the surrounding declaration/expression or text: reject(event) {. Read it with the preceding opening statement (}); it is not a standalone business operation.
103	`    this.decide(event.target.dataset.id, false);`	Calls the named method: this.decide(event.target.dataset.id, false);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
104	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
105	`  async decide(planId, approve) {`	Continues the surrounding declaration/expression or text: async decide(planId, approve) {. Read it with the preceding opening statement (}); it is not a standalone business operation.
106	`    try {`	Starts operations whose failure is handled by the following catch/finally blocks.

Line	Source code	Explanation / reading note
107	`await decidePjp({ pjpId: planId, approve, rejectionReason: this.rejectionReasons[planId] });`	Waits for this asynchronous operation before continuing: await decidePjp({ pjpId: planId, approve, rejectionReason: this.rejectionReasons[planId] });. The returned result/error must still be handled.
108	`this.toast(`	Calls the named method: this.toast(. Its implementation defines the side effect/result; use the symbol/file index to follow it.
109	`approve ? "PJP approved" : "PJP rejected",`	Continues the surrounding declaration/expression or text: approve ? "PJP approved" : "PJP rejected",. Read it with the preceding opening statement (this.toast(); it is not a standalone business operation.
110	`"The decision and audit details were saved.",`	Continues the surrounding declaration/expression or text: "The decision and audit details were saved.",. Read it with the preceding opening statement (approve ? "PJP approved" : "PJP rejected",); it is not a standalone business operation.
111	`"success",`	Continues the surrounding declaration/expression or text: "success",. Read it with the preceding opening statement ("The decision and audit details were saved.",); it is not a standalone business operation.
112	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
113	`await this.refreshLists();`	Waits for this asynchronous operation before continuing: await this.refreshLists();. The returned result/error must still be handled.
114	`} catch (error) {`	Handles an exception from the preceding try block. Check whether it rolls back, preserves queued work or only displays an error.
115	`this.showError(error);`	Calls the named method: this.showError(error);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
116	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
117	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
118	`async refreshLists() {`	Continues the surrounding declaration/expression or text: async refreshLists() {. Read it with the preceding opening statement (}); it is not a standalone business operation.
119	`const [mine, pending] = await Promise.all([getMyPjps(), getMyApprovals()]);`	Starts independent asynchronous operations together and waits for all; rejection propagates to the surrounding error handler.

Line	Source code	Explanation / reading note
120	`    this.myPjps = this.decorate(mine);`	Calls the named method: this.myPjps = this.decorate(mine);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
121	`    this.approvals = this.decorate(pending);`	Calls the named method: this.approvals = this.decorate(pending);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
122	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

134	`this.toast("Unable to continue", error?.body?.message || error.message, "error");`	Calls the named method: this.toast("Unable to continue", error?.body?.message || error.message, "error");. Its implementation defines the side effect/result; use the symbol/file index to follow it.
135	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
136	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

force-app/main/default/lwc/pjpMonthlyPlanner/pjpMonthlyPlanner.js-meta.xml

Salesforce deployment metadata for this component. Defines version, availability, permissions or layout/configuration. XML elements configure platform behavior; they are not executable statements.

10 numbered source lines | SHA-256 060b7746b5591cfaed2fd618d89319ffafe98065b6381aa38405ef0b37f400dd

Line	Source code	Explanation / reading note
1	`<?xml version="1.0" encoding="UTF-8"?>`	Declares XML encoding/version for the Salesforce metadata file.
2	`<LightningComponentBundle xmlns="http://soap.sforce.com/2006/04/metadata">`	Opens the LightningComponentBundle block; child elements specify its configuration.
3	`    <apiVersion>65.0</apiVersion>`	Sets Salesforce API version used for this component to 65.0.
4	`    <isExposed>true</isExposed>`	Sets is Exposed in the enclosing configuration to true.
5	`    <masterLabel>PJP Monthly Planner</masterLabel>`	Sets master Label in the enclosing configuration to PJP Monthly Planner.
6	`    <targets>`	Opens the targets block; child elements specify its configuration.
7	`        <target>lightning__Tab</target>`	Sets Lightning surface on which the component can be used to lightning__Tab.
8	`        <target>lightning__AppPage</target>`	Sets Lightning surface on which the component can be used to lightning__AppPage.
9	`    </targets>`	Closes the targets configuration block.
10	`</LightningComponentBundle>`	Closes the LightningComponentBundle configuration block.

sales-rep-mobile/backend/src/allocatedBeats.test.ts

Regression tests for allocatedBeats. Fixture setup creates inputs, the action invokes behavior, and assertions compare actual results to expected outcomes. Tests with stubs do not verify the real mail provider or Salesforce transport.

sales-rep-mobile/backend/src/app.test.ts

Regression tests for app. Fixture setup creates inputs, the action invokes behavior, and assertions compare actual results to expected outcomes. Tests with stubs do not verify the real mail provider or Salesforce transport.

29	`import { createEmployeeDmsRouter } from "./dms/employeeRouter.js";`	Imports dependencies/types used below: import { createEmployeeDmsRouter } from "./dms/employeeRouter.js";. Importing a function does not call it.
30	`export const app = express();`	Assigns the right-hand expression to the named variable/property: export const app = express();. This is in-memory unless it is later persisted by an explicit call.
31	`app.use(helmet());`	Registers an HTTP route or middleware: app.use(helmet());. Registration order controls which authentication/validation runs first.
32	`app.use(cors());`	Registers an HTTP route or middleware: app.use(cors());. Registration order controls which authentication/validation runs first.
33	`app.use(express.json({ limit: "5mb" }));`	Registers an HTTP route or middleware: app.use(express.json({ limit: "5mb" }));. Registration order controls which authentication/validation runs first.
34	`// A separate audience and signing key prevent distributor sessions entering SFA.`	Developer comment/documentation: A separate audience and signing key prevent distributor sessions entering SFA. It is not executed.
35	`app.use("/api/dms", createDmsRouter());`	Registers an HTTP route or middleware: app.use("/api/dms", createDmsRouter());. Registration order controls which authentication/validation runs first.
36	`const visits = new Map<string, VisitPayload>();`	Declares/initializes local data used by the surrounding operation: const visits = new Map<string, VisitPayload>();. Collection contents and assignments below determine its purpose.
37	`const idempotency = new Map<string, unknown>();`	Declares/initializes local data used by the surrounding operation: const idempotency = new Map<string, unknown>();. Collection contents and assignments below determine its purpose.
38	`class ValidationError extends Error {`	Declares a class/type: class ValidationError extends Error {. Members below hold behavior and/or state.
39	`  status = 400;`	Assigns the right-hand expression to the named variable/property: status = 400;. This is in-memory unless it is later persisted by an explicit call.
40	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

Line	Source code	Explanation / reading note
41	`async function previousAction(objectName: string, visitId: string, key: string) {`	Declares a callable function/method: async function previousAction(objectName: string, visitId: string, key: string) {. Parameters supply its inputs; the following block implements the operation.
42	`  if (!key || env.USE_MOCK_DATA) return undefined;`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!key || env.USE_MOCK_DATA) return undefined;.
43	`  const rows = await sfRecords(`	Waits for this asynchronous operation before continuing: const rows = await sfRecords(. The returned result/error must still be handled.
44	`    \`SELECT Id FROM ${objectName} WHERE Visit__c = '${escapeSoqlLiteral(visitId)}' AND Mobile_Request_Key__c = '${escapeSoqlLiteral(key)}' LIMIT 1\`,`	Assigns the right-hand expression to the named variable/property: `SELECT Id FROM ${objectName} WHERE Visit__c = '${escapeSoqlLiteral(visitId)}' AND Mobile_Request_Key__c = '${escapeSoqlLiteral(key)}' LIMIT 1`,. This is in-memory unless it is later persisted by an explicit call.
45	`  );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
46	`  return rows[0] ? { id: rows[0].Id } : undefined;`	Returns rows[0] ? { id: rows[0].Id } : undefined to the caller (or begins returned UI markup) and ends this execution path.
47	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
48	`const sfRecords = async (soql: string) => salesforce.records(soql);`	Invokes the external-data boundary: const sfRecords = async (soql: string) => salesforce.records(soql);. Await/result checks determine whether the operation is confirmed.
49	`async function ownedVisit(id: string, employeeId: string) {`	Declares a callable function/method: async function ownedVisit(id: string, employeeId: string) {. Parameters supply its inputs; the following block implements the operation.
50	`  const cached = visits.get(id);`	Declares/initializes local data used by the surrounding operation: const cached = visits.get(id);. Collection contents and assignments below determine its purpose.
51	`  if (cached) return cached.employeeId === employeeId ? cached : undefined;`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (cached) return cached.employeeId === employeeId ? cached : undefined;.
52	`  if (env.USE_MOCK_DATA) return undefined;`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (env.USE_MOCK_DATA) return undefined;.
53	`  const restored = await restoreVisit(String(id || ""), employeeId);`	Waits for this asynchronous operation before continuing: const restored = await restoreVisit(String(id || ""), employeeId);. The returned result/error must still be handled.

Line	Source code	Explanation / reading note
54	`  if (restored) visits.set(restored.id, restored);`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (restored) visits.set(restored.id, restored);.
55	`  return restored;`	Returns restored to the caller (or begins returned UI markup) and ends this execution path.
56	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
57	`const allocatedOutletIds = (employeeId: string) =>`	Declares/initializes local data used by the surrounding operation: const allocatedOutletIds = (employeeId: string) =>. Collection contents and assignments below determine its purpose.
58	`  `SELECT Outlet__c FROM ${objectMap.distributorAllocation} WHERE Employee__c = '${employeeId}' AND Allocation_Status__c = 'Active'`;`	Assigns the right-hand expression to the named variable/property: `SELECT Outlet__c FROM ${objectMap.distributorAllocation} WHERE Employee__c = '${employeeId}' AND Allocation_Status__c = 'Active'`;. This is in-memory unless it is later persisted by an explicit call.
59	`type AuthClaims = {`	Defines a compile-time data contract: type AuthClaims = {. TypeScript types do not validate untrusted runtime JSON by themselves.
60	`  sub: string;`	Sets/declares the named object property or style/type member: sub: string;. Interpret it in the enclosing object, props or type definition.
61	`  displayName: string;`	Sets/declares the named object property or style/type member: displayName: string;. Interpret it in the enclosing object, props or type definition.
62	`  employeeId: string;`	Sets/declares the named object property or style/type member: employeeId: string;. Interpret it in the enclosing object, props or type definition.
63	`  employeeName: string;`	Sets/declares the named object property or style/type member: employeeName: string;. Interpret it in the enclosing object, props or type definition.
64	`  salesforceUserId?: string;`	Sets/declares the named object property or style/type member: salesforceUserId?: string;. Interpret it in the enclosing object, props or type definition.
65	`  beatId?: string;`	Sets/declares the named object property or style/type member: beatId?: string;. Interpret it in the enclosing object, props or type definition.
66	`  beatName?: string;`	Sets/declares the named object property or style/type member: beatName?: string;. Interpret it in the enclosing object, props or type definition.
67	`};`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

Line	Source code	Explanation / reading note
68	`type AuthenticatedRequest = express.Request & { auth?: AuthClaims };`	Defines a compile-time data contract: type AuthenticatedRequest = express.Request & { auth?: AuthClaims };. TypeScript types do not validate untrusted runtime JSON by themselves.
69	`const protect: express.RequestHandler = (request, res, next) => {`	Declares/initializes local data used by the surrounding operation: const protect: express.RequestHandler = (request, res, next) => {. Collection contents and assignments below determine its purpose.
70	`  const req = request as AuthenticatedRequest;`	Declares/initializes local data used by the surrounding operation: const req = request as AuthenticatedRequest;. Collection contents and assignments below determine its purpose.
71	`  const token = req.headers.authorization?.replace("Bearer ", "");`	Declares/initializes local data used by the surrounding operation: const token = req.headers.authorization?.replace("Bearer ", "");. Collection contents and assignments below determine its purpose.
72	`  try {`	Starts operations whose failure is handled by the following catch/finally blocks.
73	`    if (!token) throw new Error("Missing token");`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!token) throw new Error("Missing token");.
74	`    req.auth = jwt.verify(token, env.JWT_SECRET) as AuthClaims;`	Calls the named method: req.auth = jwt.verify(token, env.JWT_SECRET) as AuthClaims;. Its implementation defines the side effect/result; use the symbol/file index to follow it.
75	`    next();`	Continues the surrounding declaration/expression or text: next();. Read it with the preceding opening statement (req.auth = jwt.verify(token, env.JWT_SECRET) as AuthClaims;); it is not a standalone business operation.
76	`  } catch {`	Handles an exception from the preceding try block. Check whether it rolls back, preserves queued work or only displays an error.
77	`    return fail(res, 401, "Please login again", "UNAUTHORIZED");`	Returns fail(res, 401, "Please login again", "UNAUTHORIZED") to the caller (or begins returned UI markup) and ends this execution path.
78	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
79	`};`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
80	`app.get("/api/health", (_, res) => ok(res, { mockMode: env.USE_MOCK_DATA }, "SFA API is ready"));`	Registers an HTTP route or middleware: app.get("/api/health", (_, res) => ok(res, { mockMode: env.USE_MOCK_DATA }, "SFA API is ready"));. Registration order controls which authentication/validation runs first.

Line	Source code	Explanation / reading note
81	`async function findEmployee(email: string): Promise<EmployeeIdentity | undefined> {`	Declares a callable function/method: async function findEmployee(email: string): Promise<EmployeeIdentity | undefined> {. Parameters supply its inputs; the following block implements the operation.
82	`  if (env.USE_MOCK_DATA) return findMockEmployee(email);`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (env.USE_MOCK_DATA) return findMockEmployee(email);.
83		Blank line separating logical sections; no executable operation.
84	`  const safeEmail = escapeSoqlLiteral(email.trim().toLowerCase());`	Declares/initializes local data used by the surrounding operation: const safeEmail = escapeSoqlLiteral(email.trim().toLowerCase());. Collection contents and assignments below determine its purpose.
85	`  const rows = await sfRecords(`	Waits for this asynchronous operation before continuing: const rows = await sfRecords(. The returned result/error must still be handled.
86	`    `SELECT Id, Name, Application_Access_Email__c, Login_Email__c, Email__c, Beat__c, Beat__r.Name, Salesforce_User__c, Salesforce_User__r.Name, Salesforce_User__r.Email, Salesforce_User__r.Username, Salesforce_User__r.IsActive FROM ${objectMap.salesRep} WHERE Active__c = true AND (Application_Access_Email__c = '${safeEmail}' OR Login_Email__c = '${safeEmail}' OR Email__c = '${safeEmail}' OR Salesforce_User__r.Email = '${safeEmail}' OR Salesforce_User__r.Username = '${safeEmail}') ORDER BY Employee_Code__c NULLS LAST LIMIT 1`,`	Assigns the right-hand expression to the named variable/property: `SELECT Id, Name, Application_Access_Email__c, Login_Email__c, Email__c, Beat__c, Beat__r.Name, Salesforce_User__c, Salesforce_User__r.Name, Salesforce_User__r.Email, Salesforce_User__r.Username, Sale. This is in-memory unless it is later persisted by an explicit call.
87	`  );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
88	`  const row = rows[0];`	Declares/initializes local data used by the surrounding operation: const row = rows[0];. Collection contents and assignments below determine its purpose.
89	`  if (!row || (row.Salesforce_User__c && row.Salesforce_User__r?.IsActive === false))`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!row || (row.Salesforce_User__c && row.Salesforce_User__r?.IsActive === false)).
90	`    return undefined;`	Returns undefined to the caller (or begins returned UI markup) and ends this execution path.
91	`  return {`	Returns { to the caller (or begins returned UI markup) and ends this execution path.
92	`    id: row.Id,`	Sets/declares the named object property or style/type member: id: row.Id,. Interpret it in the enclosing object, props or type definition.
93	`    email: String(`	Sets/declares the named object property or style/type member: email: String(. Interpret it in the enclosing object, props or type definition.

148	`productive: 0,`	Sets/declares the named object property or style/type member: productive: 0,. Interpret it in the enclosing object, props or type definition.
149	`});`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
150	`const beat = beatGroups.get(beatId);`	Declares/initializes local data used by the surrounding operation: const beat = beatGroups.get(beatId);. Collection contents and assignments below determine its purpose.
151	`beat.assigned++;`	Continues the surrounding declaration/expression or text: beat.assigned++;. Read it with the preceding opening statement (const beat = beatGroups.get(beatId);); it is not a standalone business operation.
152	`if (plannedBeats.has(outlet.Beat__c)) beat.planned++;`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (plannedBeats.has(outlet.Beat__c)) beat.planned++;.
153	`if (visited.has(outlet.Id)) beat.visited++;`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (visited.has(outlet.Id)) beat.visited++;.
154	`if (productive.has(outlet.Id)) beat.productive++;`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (productive.has(outlet.Id)) beat.productive++;.
155	`const areaId = outlet.Geography__c || "unassigned";`	Declares/initializes local data used by the surrounding operation: const areaId = outlet.Geography__c || "unassigned";. Collection contents and assignments below determine its purpose.
156	`if (!coverageAreas.has(areaId))`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!coverageAreas.has(areaId)).
157	`coverageAreas.set(areaId, {`	Calls the named method: coverageAreas.set(areaId, {. Its implementation defines the side effect/result; use the symbol/file index to follow it.
158	`id: areaId,`	Sets/declares the named object property or style/type member: id: areaId,. Interpret it in the enclosing object, props or type definition.

Line	Source code	Explanation / reading note
159	`name: outlet.Geography__r?.Name || "No area assigned",`	Sets/declares the named object property or style/type member: name: outlet.Geography__r?.Name || "No area assigned",. Interpret it in the enclosing object, props or type definition.
160	`outlets: 0,`	Sets/declares the named object property or style/type member: outlets: 0,. Interpret it in the enclosing object, props or type definition.
161	`buyers: 0,`	Sets/declares the named object property or style/type member: buyers: 0,. Interpret it in the enclosing object, props or type definition.
162	`});`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
163	`const area = coverageAreas.get(areaId);`	Declares/initializes local data used by the surrounding operation: const area = coverageAreas.get(areaId);. Collection contents and assignments below determine its purpose.
164	`area.outlets++;`	Continues the surrounding declaration/expression or text: area.outlets++;. Read it with the preceding opening statement (const area = coverageAreas.get(areaId);); it is not a standalone business operation.
165	`if (buyers.has(outlet.Id)) area.buyers++;`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (buyers.has(outlet.Id)) area.buyers++;.
166	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
167	`const areas = [...coverageAreas.values()].map((row) => ({`	Declares/initializes local data used by the surrounding operation: const areas = [...coverageAreas.values()].map((row) => ({. Collection contents and assignments below determine its purpose.
168	`...row,`	Continues the surrounding declaration/expression or text: ...row,. Read it with the preceding opening statement (const areas = [...coverageAreas.values()].map((row) => ({); it is not a standalone business operation.
169	`percent: percent(row.buyers, row.outlets),`	Sets/declares the named object property or style/type member: percent: percent(row.buyers, row.outlets),. Interpret it in the enclosing object, props or type definition.
170	`}));`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

Line	Source code	Explanation / reading note
171	`  const coverage = {`	Declares/initializes local data used by the surrounding operation: const coverage = {. Collection contents and assignments below determine its purpose.
172	`    outlets: areas.reduce((n, r) => n + r.outlets, 0),`	Sets/declares the named object property or style/type member: outlets: areas.reduce((n, r) => n + r.outlets, 0),. Interpret it in the enclosing object, props or type definition.
173	`    buyers: areas.reduce((n, r) => n + r.buyers, 0),`	Sets/declares the named object property or style/type member: buyers: areas.reduce((n, r) => n + r.buyers, 0),. Interpret it in the enclosing object, props or type definition.
174	`    percent: null as number | null,`	Sets/declares the named object property or style/type member: percent: null as number | null,. Interpret it in the enclosing object, props or type definition.
175	`    areas,`	Continues the surrounding declaration/expression or text: areas,. Read it with the preceding opening statement (percent: null as number | null,); it is not a standalone business operation.
176	`  };`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
177	`  coverage.percent = percent(coverage.buyers, coverage.outlets);`	Assigns the right-hand expression to the named variable/property: coverage.percent = percent(coverage.buyers, coverage.outlets);. This is in-memory unless it is later persisted by an explicit call.
178	`  const moved = new Set(`	Declares/initializes local data used by the surrounding operation: const moved = new Set(. Collection contents and assignments below determine its purpose.
179	`    data.movement.filter((row) => amount(row.Stock_Out_Pieces__c) > 0).map((row) => row.Product__c),`	Transforms/selects/aggregates collection values with the callback shown here: data.movement.filter((row) => amount(row.Stock_Out_Pieces__c) > 0).map((row) => row.Product__c),. Read the callback body and result assignment together.
180	`  );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
181	`  const batches: Row[] = data.inventory.map((row) => {`	Declares/initializes local data used by the surrounding operation: const batches: Row[] = data.inventory.map((row) => {. Collection contents and assignments below determine its purpose.
182	`    const inStock = amount(row.On_Hand_Pieces__c) > 0;`	Declares/initializes local data used by the surrounding operation: const inStock = amount(row.On_Hand_Pieces__c) > 0;. Collection contents and assignments below determine its purpose.
183	`    return {`	Returns { to the caller (or begins returned UI markup) and ends this execution path.

Line	Source code	Explanation / reading note
184	`...row,`	Continues the surrounding declaration/expression or text: ...row,. Read it with the preceding opening statement (return {); it is not a standalone business operation.
185	`expired: inStock && !!row.Expiry_Date__c && row.Expiry_Date__c < period.today,`	Sets/declares the named object property or style/type member: expired: inStock && !!row.Expiry_Date__c && row.Expiry_Date__c < period.today,. Interpret it in the enclosing object, props or type definition.
186	`nearExpiry:`	Sets/declares the named object property or style/type member: nearExpiry:. Interpret it in the enclosing object, props or type definition.
187	`inStock &&`	Continues the surrounding declaration/expression or text: inStock &&. Read it with the preceding opening statement (nearExpiry:); it is not a standalone business operation.
188	`!!row.Expiry_Date__c &&`	Continues the surrounding declaration/expression or text: !!row.Expiry_Date__c &&. Read it with the preceding opening statement (inStock &&); it is not a standalone business operation.
189	`row.Expiry_Date__c >= period.today &&`	Continues the surrounding declaration/expression or text: row.Expiry_Date__c >= period.today &&. Read it with the preceding opening statement (!!row.Expiry_Date__c &&); it is not a standalone business operation.
190	`row.Expiry_Date__c <= period.nearExpiry,`	Continues the surrounding declaration/expression or text: row.Expiry_Date__c <= period.nearExpiry,. Read it with the preceding opening statement (row.Expiry_Date__c >= period.today &&); it is not a standalone business operation.
191	`noRecentSales: inStock && !moved.has(row.Product__c),`	Sets/declares the named object property or style/type member: noRecentSales: inStock && !moved.has(row.Product__c),. Interpret it in the enclosing object, props or type definition.
192	`};`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
193	`});`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
194	`return {`	Returns { to the caller (or begins returned UI markup) and ends this execution path.
195	`period,`	Continues the surrounding declaration/expression or text: period,. Read it with the preceding opening statement (return {); it is not a standalone business operation.
196	`calculatedAt: now.toISOString(),`	Sets/declares the named object property or style/type member: calculatedAt: now.toISOString(),. Interpret it in the enclosing object, props or type definition.

Line	Source code	Explanation / reading note
197	`    sales,`	Continues the surrounding declaration/expression or text: sales,. Read it with the preceding opening statement (calculatedAt: now.toISOString(),); it is not a standalone business operation.
198	`    beats: [...beatGroups.values()].map((row) => ({`	Sets/declares the named object property or style/type member: beats: [...beatGroups.values()].map((row) => ({. Interpret it in the enclosing object, props or type definition.
199	`      ...row,`	Continues the surrounding declaration/expression or text: ...row,. Read it with the preceding opening statement (beats: [...beatGroups.values()].map((row) => ({); it is not a standalone business operation.
200	`      productivity: percent(row.productive, row.visited),`	Sets/declares the named object property or style/type member: productivity: percent(row.productive, row.visited),. Interpret it in the enclosing object, props or type definition.
201	`    })),`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
202	`    coverage,`	Continues the surrounding declaration/expression or text: coverage,. Read it with the preceding opening statement (})),); it is not a standalone business operation.
203	`    stock: {`	Sets/declares the named object property or style/type member: stock: {. Interpret it in the enclosing object, props or type definition.
204	`      onHand: batches.reduce((n, r) => n + amount(r.On_Hand_Pieces__c), 0),`	Sets/declares the named object property or style/type member: onHand: batches.reduce((n, r) => n + amount(r.On_Hand_Pieces__c), 0),. Interpret it in the enclosing object, props or type definition.
205	`      available: batches.reduce((n, r) => n + amount(r.Available_Pieces__c), 0),`	Sets/declares the named object property or style/type member: available: batches.reduce((n, r) => n + amount(r.Available_Pieces__c), 0),. Interpret it in the enclosing object, props or type definition.
206	`      nearExpiry: batches.filter((r) => r.nearExpiry).length,`	Sets/declares the named object property or style/type member: nearExpiry: batches.filter((r) => r.nearExpiry).length,. Interpret it in the enclosing object, props or type definition.
207	`      expired: batches.filter((r) => r.expired).length,`	Sets/declares the named object property or style/type member: expired: batches.filter((r) => r.expired).length,. Interpret it in the enclosing object, props or type definition.
208	`      noRecentSales: batches.filter((r) => r.noRecentSales).length,`	Sets/declares the named object property or style/type member: noRecentSales: batches.filter((r) => r.noRecentSales).length,. Interpret it in the enclosing object, props or type definition.

Line	Source code	Explanation / reading note
209	`batches,`	Continues the surrounding declaration/expression or text: batches,. Read it with the preceding opening statement (noRecentSales: batches.filter((r) => r.noRecentSales).length,); it is not a standalone business operation.
210	`},`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
211	`definitions: {`	Sets/declares the named object property or style/type member: definitions: {. Interpret it in the enclosing object, props or type definition.
212	`beats:`	Sets/declares the named object property or style/type member: beats:. Interpret it in the enclosing object, props or type definition.
213	`"Unique active assigned outlets in approved monthly PJP beats; visited = Checked In or Completed; productive = visited outlets with a qualifying order on that visit. Ad-hoc visits can exceed planned shops.",`	Assigns the right-hand expression to the named variable/property: "Unique active assigned outlets in approved monthly PJP beats; visited = Checked In or Completed; productive = visited outlets with a qualifying order on that visit. Ad-hoc visits can exceed planned s. This is in-memory unless it is later persisted by an explicit call.
214	`coverage:`	Sets/declares the named object property or style/type member: coverage:. Interpret it in the enclosing object, props or type definition.
215	`"Active assigned outlets with a positive booked order this month / active assigned outlets.",`	Continues the surrounding declaration/expression or text: "Active assigned outlets with a positive booked order this month / active assigned outlets.",. Read it with the preceding opening statement (coverage:); it is not a standalone business operation.
216	`stock:`	Sets/declares the named object property or style/type member: stock:. Interpret it in the enclosing object, props or type definition.
217	`"Near expiry = next 30 days. No recent sales = no issued invoice stock movement in the past 30 days; new stock may also be flagged. Review before calling it slow-moving.",`	Assigns the right-hand expression to the named variable/property: "Near expiry = next 30 days. No recent sales = no issued invoice stock movement in the past 30 days; new stock may also be flagged. Review before calling it slow-moving.",. This is in-memory unless it is later persisted by an explicit call.
218	`},`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
219	`};`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
220	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

sales-rep-mobile/backend/src/dms/router.test.ts

Regression tests for router. Fixture setup creates inputs, the action invokes behavior, and assertions compare actual results to expected outcomes. Tests with stubs do not verify the real mail provider or Salesforce transport.

117	`      !timingSafeEqual(entry.digest, hash(String(req.body.code)))`	Continues the surrounding declaration/expression or text: !timingSafeEqual(entry.digest, hash(String(req.body.code))). Read it with the preceding opening statement (++entry.attempts > 5 ||); it is not a standalone business operation.
118	`    ) {`	Continues the surrounding declaration/expression or text:) {. Read it with the preceding opening statement (!timingSafeEqual(entry.digest, hash(String(req.body.code)))); it is not a standalone business operation.
119	`      if (entry && (entry.attempts >= 5 || entry.expires < Date.now())) codes.delete(email);`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (entry && (entry.attempts >= 5 || entry.expires < Date.now())) codes.delete(email);.
120	`      return fail(res, 401, "Invalid or expired code", "INVALID_CODE");`	Returns fail(res, 401, "Invalid or expired code", "INVALID_CODE") to the caller (or begins returned UI markup) and ends this execution path.
121	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
122	`    codes.delete(email);`	Calls the named method: codes.delete(email);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
123	`    const distributor = await find(email);`	Waits for this asynchronous operation before continuing: const distributor = await find(email);. The returned result/error must still be handled.
124	`    if (!distributor)`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!distributor).
125	`      return fail(res, 403, "Distributor login is no longer active or unique", "DISABLED");`	Returns fail(res, 403, "Distributor login is no longer active or unique", "DISABLED") to the caller (or begins returned UI markup) and ends this execution path.
126	`    return ok(res, {`	Returns ok(res, { to the caller (or begins returned UI markup) and ends this execution path.
127	`      token: jwt.sign({ distributorId: distributor.Id, email }, secret(), {`	Sets/declares the named object property or style/type member: token: jwt.sign({ distributorId: distributor.Id, email }, secret(), {. Interpret it in the enclosing object, props or type definition.
128	`        algorithm: "HS256",`	Sets/declares the named object property or style/type member: algorithm: "HS256",. Interpret it in the enclosing object, props or type definition.
129	`        audience,`	Continues the surrounding declaration/expression or text: audience,. Read it with the preceding opening statement (algorithm: "HS256",); it is not a standalone business operation.

Line	Source code	Explanation / reading note
130	`expiresIn: "8h",`	Sets/declares the named object property or style/type member: expiresIn: "8h",. Interpret it in the enclosing object, props or type definition.
131	`}),`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
132	`user: { id: distributor.Id, name: distributor.Name },`	Sets/declares the named object property or style/type member: user: { id: distributor.Id, name: distributor.Name },. Interpret it in the enclosing object, props or type definition.
133	`});`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
134	`});`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
135	`router.use(async (req, res, next) => {`	Registers an HTTP route or middleware: router.use(async (req, res, next) => {. Registration order controls which authentication/validation runs first.
136	`let claims: Claims;`	Declares/initializes local data used by the surrounding operation: let claims: Claims;. Collection contents and assignments below determine its purpose.
137	`try {`	Starts operations whose failure is handled by the following catch/finally blocks.
138	`claims = jwt.verify(req.headers.authorization?.replace(/^Bearer /, "") || "", secret(), {`	Calls the named method: claims = jwt.verify(req.headers.authorization?.replace(/^Bearer /, "") || "", secret(), {. Its implementation defines the side effect/result; use the symbol/file index to follow it.
139	`algorithms: ["HS256"],`	Sets/declares the named object property or style/type member: algorithms: ["HS256"],. Interpret it in the enclosing object, props or type definition.
140	`audience,`	Continues the surrounding declaration/expression or text: audience,. Read it with the preceding opening statement (algorithms: ["HS256"],); it is not a standalone business operation.
141	`}) as Claims;`	Continues the surrounding declaration/expression or text: }) as Claims;. Read it with the preceding opening statement (audience,); it is not a standalone business operation.
142	`idInput.parse(claims.distributorId);`	Calls the named method: idInput.parse(claims.distributorId);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
143	`emailInput.parse(claims.email);`	Calls the named method: emailInput.parse(claims.email);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
