sales-rep-mobile/backend/src/dms/transport.simulation.test.ts

Regression tests for transport.simulation. Fixture setup creates inputs, the action invokes behavior, and assertions compare actual results to expected outcomes. Tests with stubs do not verify the real mail provider or Salesforce transport.

6	`  const auth = await run(["org", "auth", "show-access-token"]);`	Waits for this asynchronous operation before continuing: const auth = await run(["org", "auth", "show-access-token"]);. The returned result/error must still be handled.
7	`  const org = auth?.instanceUrl || configuredUrl ? null : await run(["org", "display"]);`	Waits for this asynchronous operation before continuing: const org = auth?.instanceUrl || configuredUrl ? null : await run(["org", "display"]);. The returned result/error must still be handled.
8	`  const instanceUrl = auth?.instanceUrl || configuredUrl || org?.instanceUrl;`	Declares/initializes local data used by the surrounding operation: const instanceUrl = auth?.instanceUrl || configuredUrl || org?.instanceUrl;. Collection contents and assignments below determine its purpose.
9	`  let url: URL;`	Declares/initializes local data used by the surrounding operation: let url: URL;. Collection contents and assignments below determine its purpose.
10	`  try {`	Starts operations whose failure is handled by the following catch/finally blocks.
11	`    url = new URL(instanceUrl);`	Assigns the right-hand expression to the named variable/property: url = new URL(instanceUrl);. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
12	`    if (url.protocol !== "https:" || url.username || url.password || url.search || url.hash)`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (url.protocol !== "https:" || url.username || url.password || url.search || url.hash).
13	`      throw new Error();`	Stops this execution path with a validation/error exception: throw new Error();. The caller/catch block decides how it is reported.
14	`  } catch {`	Handles an exception from the preceding try block. Check whether it rolls back, preserves queued work or only displays an error.
15	`    throw new Error(`	Stops this execution path with a validation/error exception: throw new Error(. The caller/catch block decides how it is reported.
16	`      "Salesforce instance URL is missing or invalid. Reconnect the configured Salesforce org.",`	Continues the surrounding declaration/expression or text: "Salesforce instance URL is missing or invalid. Reconnect the configured Salesforce org.",. Read it with the preceding opening statement (throw new Error(); it is not a standalone business operation.
17	`    );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
18	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
19	`  if (typeof auth?.accessToken !== "string" || !auth.accessToken.trim())`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (typeof auth?.accessToken !== "string" || !auth.accessToken.trim()).
20	`    throw new Error(`	Stops this execution path with a validation/error exception: throw new Error(. The caller/catch block decides how it is reported.
21	`      "Salesforce CLI returned no access token. Reconnect the configured Salesforce org.",`	Continues the surrounding declaration/expression or text: "Salesforce CLI returned no access token. Reconnect the configured Salesforce org.",. Read it with the preceding opening statement (throw new Error(); it is not a standalone business operation.
22	`    );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
23	`  return { accessToken: auth.accessToken, instanceUrl: url.origin };`	Returns { accessToken: auth.accessToken, instanceUrl: url.origin } to the caller (or begins returned UI markup) and ends this execution path.
24	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

sales-rep-mobile/backend/src/scripts/sendDistributorInvitation.ts

First-party shared backend file: send Distributor Invitation. Read imports/exports and the symbol outline to locate its caller and responsibility. Detailed operations appear beside the numbered source.

42 numbered source lines | SHA-256 f567f5ab4d00183ec9dab07b8ea10195d95a992e25599af876a652c2278b6ce0

sales-rep-mobile/backend/src/utils/distance.ts

Haversine coordinate distance calculation in metres used for visit radius decisions.

13 numbered source lines | SHA-256 7cdc7c28ec528e917c0ce2fc566aff1de2972c6f2f33e832fbd568054170b41e

Line	Source code	Explanation / reading note
1	`const radians = (value: number) => (value * Math.PI) / 180;`	Declares/initializes local data used by the surrounding operation: const radians = (value: number) => (value * Math.PI) / 180;. Collection contents and assignments below determine its purpose.
2	`export function distanceInMeters(`	Declares a callable function/method: export function distanceInMeters(. Parameters supply its inputs; the following block implements the operation.
3	`  a: { latitude: number; longitude: number },`	Sets/declares the named object property or style/type member: a: { latitude: number; longitude: number },. Interpret it in the enclosing object, props or type definition.
4	`  b: { latitude: number; longitude: number },`	Sets/declares the named object property or style/type member: b: { latitude: number; longitude: number },. Interpret it in the enclosing object, props or type definition.
5	`) {`	Continues the surrounding declaration/expression or text:) {. Read it with the preceding opening statement (b: { latitude: number; longitude: number },); it is not a standalone business operation.
6	`  const radius = 6371000,`	Declares/initializes local data used by the surrounding operation: const radius = 6371000,. Collection contents and assignments below determine its purpose.
7	`    dLat = radians(b.latitude - a.latitude),`	Assigns the right-hand expression to the named variable/property: dLat = radians(b.latitude - a.latitude),. This is in-memory unless it is later persisted by an explicit call.
8	`    dLon = radians(b.longitude - a.longitude);`	Assigns the right-hand expression to the named variable/property: dLon = radians(b.longitude - a.longitude);. This is in-memory unless it is later persisted by an explicit call.
9	`  const value =`	Declares/initializes local data used by the surrounding operation: const value =. Collection contents and assignments below determine its purpose.
10	`    Math.sin(dLat / 2) ** 2 +`	Calls the named method: Math.sin(dLat / 2) ** 2 +. Its implementation defines the side effect/result; use the symbol/file index to follow it.
11	`    Math.cos(radians(a.latitude)) * Math.cos(radians(b.latitude)) * Math.sin(dLon / 2) ** 2;`	Calls the named method: Math.cos(radians(a.latitude)) * Math.cos(radians(b.latitude)) * Math.sin(dLon / 2) ** 2;. Its implementation defines the side effect/result; use the symbol/file index to follow it.

Line	Source code	Explanation / reading note
12	`  return Math.round(radius * 2 * Math.atan2(Math.sqrt(value), Math.sqrt(1 - value)));`	Returns Math.round(radius * 2 * Math.atan2(Math.sqrt(value), Math.sqrt(1 - value))) to the caller (or begins returned UI markup) and ends this execution path.
13	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

sales-rep-mobile/backend/src/utils/http.ts

Consistent HTTP success/failure response helpers. Clients must check both status and success/error fields.

5 numbered source lines | SHA-256 69b0814eddfcbbca41fd886b7348b1ccb8e593d582cb0b5a26daa7115fdfc1de

Line	Source code	Explanation / reading note
1	`import type { Response } from "express";`	Imports dependencies/types used below: import type { Response } from "express";. Importing a function does not call it.
2	`export const ok = (res: Response, data: unknown, message = "Operation successful") =>`	Assigns the right-hand expression to the named variable/property: export const ok = (res: Response, data: unknown, message = "Operation successful") =>. This is in-memory unless it is later persisted by an explicit call.
3	`  res.json({ success: true, data, message });`	Calls the named method: res.json({ success: true, data, message });. Its implementation defines the side effect/result; use the symbol/file index to follow it.
4	`export const fail = (res: Response, status: number, message: string, errorCode: string) =>`	Assigns the right-hand expression to the named variable/property: export const fail = (res: Response, status: number, message: string, errorCode: string) =>. This is in-memory unless it is later persisted by an explicit call.
5	`  res.status(status).json({ success: false, data: null, message, errorCode });`	Calls the named method: res.status(status).json({ success: false, data: null, message, errorCode });. Its implementation defines the side effect/result; use the symbol/file index to follow it.

sales-rep-mobile/backend/src/utils/salesforce.ts

SOQL literal escaping helper; input validation and authorization remain necessary in callers.

10 numbered source lines | SHA-256 d6c9f00fcc552015638ab7e8503db025172aa8627db8323493a9a49c636ad938

Line	Source code	Explanation / reading note
1	`export function escapeSoqlLiteral(value: string) {`	Declares a callable function/method: export function escapeSoqlLiteral(value: string) {. Parameters supply its inputs; the following block implements the operation.
2	`  return value.replace(/\\/g, "\\\\").replace(/'/g, "\\'");`	Returns value.replace(/\\/g, "\\\\").replace(/'/g, "\\'") to the caller (or begins returned UI markup) and ends this execution path.
3	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
4		Blank line separating logical sections; no executable operation.
5	`export function requireSalesforceId(value: unknown, label: string) {`	Declares a callable function/method: export function requireSalesforceId(value: unknown, label: string) {. Parameters supply its inputs; the following block implements the operation.
6	`  if (typeof value !== "string" || !/^[a-zA-Z0-9]{15,18}$/.test(value)) {`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (typeof value !== "string" || !/^[a-zA-Z0-9]{15,18}$/.test(value)) {.
7	`    throw new Error(`${label} is invalid`);`	Stops this execution path with a validation/error exception: throw new Error(`${label} is invalid`);. The caller/catch block decides how it is reported.
8	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
9	`  return value;`	Returns value to the caller (or begins returned UI markup) and ends this execution path.
10	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

sales-rep-mobile/backend/src/visitRecovery.test.ts

Regression tests for visitRecovery. Fixture setup creates inputs, the action invokes behavior, and assertions compare actual results to expected outcomes. Tests with stubs do not verify the real mail provider or Salesforce transport.

51 numbered source lines | SHA-256 885fd84ae18b6145e42235388fc8a956d61ba8ef2cc4ba854ff2a23f40e9f964

Line	Source code	Explanation / reading note
1	`import { beforeEach, describe, expect, it, vi } from "vitest";`	Imports dependencies/types used below: import { beforeEach, describe, expect, it, vi } from "vitest";. Importing a function does not call it.
2	`import { salesforce, SalesforceService } from "./salesforce/SalesforceService.js";`	Imports dependencies/types used below: import { salesforce, SalesforceService } from "./salesforce/SalesforceService.js";. Importing a function does not call it.
3	`import { restoreVisit } from "./services/visitRecovery.js";`	Imports dependencies/types used below: import { restoreVisit } from "./services/visitRecovery.js";. Importing a function does not call it.
4		Blank line separating logical sections; no executable operation.
5	`describe("durable visit recovery", () => {`	Continues the surrounding declaration/expression or text: describe("durable visit recovery", () => {. Read it with the preceding opening statement; it is not a standalone business operation.
6	`  beforeEach(() => vi.restoreAllMocks());`	Calls the named method: beforeEach(() => vi.restoreAllMocks());. Its implementation defines the side effect/result; use the symbol/file index to follow it.
7	`  it("only restores a visit owned by the signed-in employee", async () => {`	Continues the surrounding declaration/expression or text: it("only restores a visit owned by the signed-in employee", async () => {. Read it with the preceding opening statement (beforeEach(() => vi.restoreAllMocks());); it is not a standalone business operation.
8	`    const records = vi.spyOn(salesforce, "records").mockResolvedValue([]);`	Declares/initializes local data used by the surrounding operation: const records = vi.spyOn(salesforce, "records").mockResolvedValue([]);. Collection contents and assignments below determine its purpose.
9	`    expect(await restoreVisit("visit-id", "employee-id")).toBeUndefined();`	Test assertion comparing an expected outcome to actual behavior: expect(await restoreVisit("visit-id", "employee-id")).toBeUndefined();. A mismatch fails the test.
10	`    expect(records.mock.calls[0][0]).toContain("Employee__c = 'employee-id'");`	Test assertion comparing an expected outcome to actual behavior: expect(records.mock.calls[0][0]).toContain("Employee__c = 'employee-id'");. A mismatch fails the test.
11	`  });`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

sales-rep-mobile/mobile/src/components/ExpenseClaimEditor.test.tsx

Regression tests for ExpenseClaimEditor. Fixture setup creates inputs, the action invokes behavior, and assertions compare actual results to expected outcomes. Tests with stubs do not verify the real mail provider or Salesforce transport.

166	`onSelect={setPlannedActivity}`	Assigns the right-hand expression to the named variable/property: onSelect={setPlannedActivity}. This is in-memory unless it is later persisted by an explicit call.
167	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (onSelect={setPlannedActivity}); it is not a standalone business operation.
168		Blank line separating logical sections; no executable operation.
169	`<Text style={styles.label}>Start odometer (km)</Text>`	Renders/opens a UI element or component: <Text style={styles.label}>Start odometer (km)</Text>. Props and child content below determine appearance and interactions.
170	`<TextInput`	Renders/opens a UI element or component: <TextInput. Props and child content below determine appearance and interactions.
171	`style={styles.input}`	Assigns the right-hand expression to the named variable/property: style={styles.input}. This is in-memory unless it is later persisted by an explicit call.
172	`keyboardType="decimal-pad"`	Assigns the right-hand expression to the named variable/property: keyboardType="decimal-pad". This is in-memory unless it is later persisted by an explicit call.
173	`value={startOdometer}`	Assigns the right-hand expression to the named variable/property: value={startOdometer}. This is in-memory unless it is later persisted by an explicit call.
174	`onChangeText={setStartOdometer}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
175	`placeholder="Example: 12450"`	Assigns the right-hand expression to the named variable/property: placeholder="Example: 12450". This is in-memory unless it is later persisted by an explicit call.
176	`editable={!attendanceId}`	Assigns the right-hand expression to the named variable/property: editable={!attendanceId}. This is in-memory unless it is later persisted by an explicit call.
177	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (editable={!attendanceId}); it is not a standalone business operation.
178	`<TouchableOpacity`	Renders/opens a UI element or component: <TouchableOpacity. Props and child content below determine appearance and interactions.

Line	Source code	Explanation / reading note
179	`style={[styles.primaryButton, (busy || !!attendanceId) && styles.disabled]}`	Assigns the right-hand expression to the named variable/property: style={[styles.primaryButton, (busy || !!attendanceId) && styles.disabled]}. This is in-memory unless it is later persisted by an explicit call.
180	`disabled={busy || !!attendanceId}`	Controls whether this button/input accepts interaction. Evaluate this expression when diagnosing an unclickable control.
181	`onPress={startDay}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
182	`>`	Continues the surrounding declaration/expression or text: >. Read it with the preceding opening statement (onPress={startDay}); it is not a standalone business operation.
183	`<Text style={styles.primaryButtonText}>START ODOMETER</Text>`	Renders/opens a UI element or component: <Text style={styles.primaryButtonText}>START ODOMETER</Text>. Props and child content below determine appearance and interactions.
184	`</TouchableOpacity>`	Closes the UI element/component opened above.
185		Blank line separating logical sections; no executable operation.
186	`<Text style={styles.label}>End odometer (km)</Text>`	Renders/opens a UI element or component: <Text style={styles.label}>End odometer (km)</Text>. Props and child content below determine appearance and interactions.
187	`<TextInput`	Renders/opens a UI element or component: <TextInput. Props and child content below determine appearance and interactions.
188	`style={styles.input}`	Assigns the right-hand expression to the named variable/property: style={styles.input}. This is in-memory unless it is later persisted by an explicit call.
189	`keyboardType="decimal-pad"`	Assigns the right-hand expression to the named variable/property: keyboardType="decimal-pad". This is in-memory unless it is later persisted by an explicit call.
190	`value={endOdometer}`	Assigns the right-hand expression to the named variable/property: value={endOdometer}. This is in-memory unless it is later persisted by an explicit call.
191	`onChangeText={setEndOdometer}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
192	`placeholder="Example: 12525"`	Assigns the right-hand expression to the named variable/property: placeholder="Example: 12525". This is in-memory unless it is later persisted by an explicit call.
193	`editable={!!attendanceId && !travelSummary}`	Assigns the right-hand expression to the named variable/property: editable={!!attendanceId && !travelSummary}. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
194	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (editable={!!attendanceId && !travelSummary}); it is not a standalone business operation.
195	`<Text style={styles.label}>Evidence URL (optional)</Text>`	Renders/opens a UI element or component: <Text style={styles.label}>Evidence URL (optional)</Text>. Props and child content below determine appearance and interactions.
196	`<TextInput`	Renders/opens a UI element or component: <TextInput. Props and child content below determine appearance and interactions.
197	`style={styles.input}`	Assigns the right-hand expression to the named variable/property: style={styles.input}. This is in-memory unless it is later persisted by an explicit call.
198	`autoCapitalize="none"`	Assigns the right-hand expression to the named variable/property: autoCapitalize="none". This is in-memory unless it is later persisted by an explicit call.
199	`value={evidenceUrl}`	Assigns the right-hand expression to the named variable/property: value={evidenceUrl}. This is in-memory unless it is later persisted by an explicit call.
200	`onChangeText={setEvidenceUrl}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
201	`placeholder="Receipt or odometer-photo URL"`	Assigns the right-hand expression to the named variable/property: placeholder="Receipt or odometer-photo URL". This is in-memory unless it is later persisted by an explicit call.
202	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (placeholder="Receipt or odometer-photo URL"); it is not a standalone business operation.
203	`<TouchableOpacity`	Renders/opens a UI element or component: <TouchableOpacity. Props and child content below determine appearance and interactions.
204	`style={[`	Assigns the right-hand expression to the named variable/property: style={[. This is in-memory unless it is later persisted by an explicit call.
205	`styles.primaryButton,`	Continues the surrounding declaration/expression or text: styles.primaryButton,. Read it with the preceding opening statement (style={[); it is not a standalone business operation.
206	`(busy || !attendanceId || !!travelSummary) && styles.disabled,`	Continues the surrounding declaration/expression or text: (busy || !attendanceId || !!travelSummary) && styles.disabled,. Read it with the preceding opening statement (styles.primaryButton,); it is not a standalone business operation.

Line	Source code	Explanation / reading note
207	`]}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
208	`disabled={busy || !attendanceId || !!travelSummary}`	Controls whether this button/input accepts interaction. Evaluate this expression when diagnosing an unclickable control.
209	`onPress={endDay}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
210	`>`	Continues the surrounding declaration/expression or text: >. Read it with the preceding opening statement (onPress={endDay}); it is not a standalone business operation.
211	`<Text style={styles.primaryButtonText}>END ODOMETER</Text>`	Renders/opens a UI element or component: <Text style={styles.primaryButtonText}>END ODOMETER</Text>. Props and child content below determine appearance and interactions.
212	`</TouchableOpacity>`	Closes the UI element/component opened above.
213		Blank line separating logical sections; no executable operation.
214	`{travelSummary && (`	Continues the surrounding declaration/expression or text: {travelSummary && (. Read it with the preceding opening statement; it is not a standalone business operation.
215	`<View style={styles.summaryCard}>`	Renders/opens a UI element or component: <View style={styles.summaryCard}>. Props and child content below determine appearance and interactions.
216	`<Text style={styles.summaryTitle}>Salesforce Calculation</Text>`	Renders/opens a UI element or component: <Text style={styles.summaryTitle}>Salesforce Calculation</Text>. Props and child content below determine appearance and interactions.
217	`<View style={styles.summaryLine}>`	Renders/opens a UI element or component: <View style={styles.summaryLine}>. Props and child content below determine appearance and interactions.
218	`<Text>Distance travelled</Text>`	Renders/opens a UI element or component: <Text>Distance travelled</Text>. Props and child content below determine appearance and interactions.
219	`<Text style={styles.summaryValue}>`	Renders/opens a UI element or component: <Text style={styles.summaryValue}>. Props and child content below determine appearance and interactions.
220	`{travelSummary.distanceTravelledKm.toFixed(2)} km`	Calls the named method: {travelSummary.distanceTravelledKm.toFixed(2)} km. Its implementation defines the side effect/result; use the symbol/file index to follow it.
221	`</Text>`	Closes the UI element/component opened above.
222	`</View>`	Closes the UI element/component opened above.

Line	Source code	Explanation / reading note

"" : "S"} FOR APPROVAL``	Continues the surrounding declaration/expression or text: : `SUBMIT ${selectedIds.length} CLAIM${selectedIds.length === 1 ? "" : "S"} FOR APPROVAL`. Read it with the preceding opening statement (? "SUBMITTING…"); it is not a standalone business operation.
202	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
203	`onPress={submit}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.

Line	Source code	Explanation / reading note
204	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (onPress={submit}); it is not a standalone business operation.
205	`) : null}`	Continues the surrounding declaration/expression or text:) : null}. Read it with the preceding opening statement (/>); it is not a standalone business operation.
206	`</ScrollView>`	Closes the UI element/component opened above.
207	`</SafeAreaView>`	Closes the UI element/component opened above.
208	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
209	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
210		Blank line separating logical sections; no executable operation.
211	`const s = StyleSheet.create({`	Declares/initializes local data used by the surrounding operation: const s = StyleSheet.create({. Collection contents and assignments below determine its purpose.
212	`safe: { flex: 1, backgroundColor: colors.surface },`	Sets/declares the named object property or style/type member: safe: { flex: 1, backgroundColor: colors.surface },. Interpret it in the enclosing object, props or type definition.
213	`page: { padding: 14, paddingBottom: 40, maxWidth: 700, width: "100%", alignSelf: "center" },`	Sets/declares the named object property or style/type member: page: { padding: 14, paddingBottom: 40, maxWidth: 700, width: "100%", alignSelf: "center" },. Interpret it in the enclosing object, props or type definition.
214	`header: { backgroundColor: colors.navy, padding: 20, borderRadius: 20, marginBottom: 16 },`	Sets/declares the named object property or style/type member: header: { backgroundColor: colors.navy, padding: 20, borderRadius: 20, marginBottom: 16 },. Interpret it in the enclosing object, props or type definition.
215	`kicker: { color: "#9DD9C9", fontSize: 11, fontWeight: "900", letterSpacing: 1 },`	Sets/declares the named object property or style/type member: kicker: { color: "#9DD9C9", fontSize: 11, fontWeight: "900", letterSpacing: 1 },. Interpret it in the enclosing object, props or type definition.
216	`title: { color: "white", fontSize: 26, fontWeight: "900", marginTop: 6 },`	Sets/declares the named object property or style/type member: title: { color: "white", fontSize: 26, fontWeight: "900", marginTop: 6 },. Interpret it in the enclosing object, props or type definition.

Line	Source code	Explanation / reading note
217	`  copy: { color: "#D8EEE8", marginTop: 6, lineHeight: 19 },`	Sets/declares the named object property or style/type member: copy: { color: "#D8EEE8", marginTop: 6, lineHeight: 19 },. Interpret it in the enclosing object, props or type definition.
218	`  error: { color: colors.danger, textAlign: "center", marginBottom: 12 },`	Sets/declares the named object property or style/type member: error: { color: colors.danger, textAlign: "center", marginBottom: 12 },. Interpret it in the enclosing object, props or type definition.
219	`  selectionHeading: { flexDirection: "row", justifyContent: "space-between", alignItems: "center" },`	Sets/declares the named object property or style/type member: selectionHeading: { flexDirection: "row", justifyContent: "space-between", alignItems: "center" },. Interpret it in the enclosing object, props or type definition.
220	`  count: { color: colors.brand, fontWeight: "900" },`	Sets/declares the named object property or style/type member: count: { color: colors.brand, fontWeight: "900" },. Interpret it in the enclosing object, props or type definition.
221	`  policy: { marginBottom: 9, borderWidth: 1, borderColor: colors.border },`	Sets/declares the named object property or style/type member: policy: { marginBottom: 9, borderWidth: 1, borderColor: colors.border },. Interpret it in the enclosing object, props or type definition.
222	`  selected: { borderColor: colors.brand, backgroundColor: "#E7F5F3" },`	Sets/declares the named object property or style/type member: selected: { borderColor: colors.brand, backgroundColor: "#E7F5F3" },. Interpret it in the enclosing object, props or type definition.
223	`  claim: { marginTop: -4, marginBottom: 14, borderLeftWidth: 4, borderLeftColor: colors.brand },`	Sets/declares the named object property or style/type member: claim: { marginTop: -4, marginBottom: 14, borderLeftWidth: 4, borderLeftColor: colors.brand },. Interpret it in the enclosing object, props or type definition.
224	`  validationCard: { borderWidth: 1, borderColor: colors.danger, backgroundColor: "#FFF1F0" },`	Sets/declares the named object property or style/type member: validationCard: { borderWidth: 1, borderColor: colors.danger, backgroundColor: "#FFF1F0" },. Interpret it in the enclosing object, props or type definition.
225	`  validationTitle: { color: colors.danger, fontWeight: "900", fontSize: 15 },`	Sets/declares the named object property or style/type member: validationTitle: { color: colors.danger, fontWeight: "900", fontSize: 15 },. Interpret it in the enclosing object, props or type definition.
226	`  validationText: { color: colors.danger, marginTop: 5 },`	Sets/declares the named object property or style/type member: validationText: { color: colors.danger, marginTop: 5 },. Interpret it in the enclosing object, props or type definition.
227	`  row: { flexDirection: "row", gap: 8, alignItems: "center" },`	Sets/declares the named object property or style/type member: row: { flexDirection: "row", gap: 8, alignItems: "center" },. Interpret it in the enclosing object, props or type definition.

Line	Source code	Explanation / reading note
228	`policyName: { flex: 1, color: colors.ink, fontWeight: "900", fontSize: 15 },`	Sets/declares the named object property or style/type member: policyName: { flex: 1, color: colors.ink, fontWeight: "900", fontSize: 15 },. Interpret it in the enclosing object, props or type definition.
229	`type: { color: colors.brand, fontWeight: "800", fontSize: 10 },`	Sets/declares the named object property or style/type member: type: { color: colors.brand, fontWeight: "800", fontSize: 10 },. Interpret it in the enclosing object, props or type definition.
230	`detail: { color: colors.muted, marginTop: 6, fontSize: 12 },`	Sets/declares the named object property or style/type member: detail: { color: colors.muted, marginTop: 6, fontSize: 12 },. Interpret it in the enclosing object, props or type definition.
231	`scope: { color: colors.blue, fontWeight: "700", marginTop: 5, fontSize: 11 },`	Sets/declares the named object property or style/type member: scope: { color: colors.blue, fontWeight: "700", marginTop: 5, fontSize: 11 },. Interpret it in the enclosing object, props or type definition.
232	`input: {`	Sets/declares the named object property or style/type member: input: {. Interpret it in the enclosing object, props or type definition.
233	`borderWidth: 1,`	Sets/declares the named object property or style/type member: borderWidth: 1,. Interpret it in the enclosing object, props or type definition.
234	`borderColor: colors.border,`	Sets/declares the named object property or style/type member: borderColor: colors.border,. Interpret it in the enclosing object, props or type definition.
235	`borderRadius: 12,`	Sets/declares the named object property or style/type member: borderRadius: 12,. Interpret it in the enclosing object, props or type definition.
236	`padding: 13,`	Sets/declares the named object property or style/type member: padding: 13,. Interpret it in the enclosing object, props or type definition.
237	`marginTop: 10,`	Sets/declares the named object property or style/type member: marginTop: 10,. Interpret it in the enclosing object, props or type definition.
238	`color: colors.ink,`	Sets/declares the named object property or style/type member: color: colors.ink,. Interpret it in the enclosing object, props or type definition.
239	`backgroundColor: "white",`	Sets/declares the named object property or style/type member: backgroundColor: "white",. Interpret it in the enclosing object, props or type definition.
240	`},`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

Line	Source code	Explanation / reading note
241	`  flex: { flex: 1 },`	Sets/declares the named object property or style/type member: flex: { flex: 1 },. Interpret it in the enclosing object, props or type definition.

129	`<>`	Renders/opens a UI element or component: <>. Props and child content below determine appearance and interactions.
130	`<Text style={styles.label}>6-digit code</Text>`	Renders/opens a UI element or component: <Text style={styles.label}>6-digit code</Text>. Props and child content below determine appearance and interactions.
131	`<TextInput`	Renders/opens a UI element or component: <TextInput. Props and child content below determine appearance and interactions.
132	`style={styles.codeInput}`	Assigns the right-hand expression to the named variable/property: style={styles.codeInput}. This is in-memory unless it is later persisted by an explicit call.
133	`value={code}`	Assigns the right-hand expression to the named variable/property: value={code}. This is in-memory unless it is later persisted by an explicit call.
134	`onChangeText={(value: string) => setCode(value.replace(/\D/g, "").slice(0, 6))}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
135	`keyboardType="number-pad"`	Assigns the right-hand expression to the named variable/property: keyboardType="number-pad". This is in-memory unless it is later persisted by an explicit call.
136	`maxLength={6}`	Assigns the right-hand expression to the named variable/property: maxLength={6}. This is in-memory unless it is later persisted by an explicit call.
137	`placeholder="000000"`	Assigns the right-hand expression to the named variable/property: placeholder="000000". This is in-memory unless it is later persisted by an explicit call.
138	`textContentType="oneTimeCode"`	Assigns the right-hand expression to the named variable/property: textContentType="oneTimeCode". This is in-memory unless it is later persisted by an explicit call.
139	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (textContentType="oneTimeCode"); it is not a standalone business operation.
140	`{delivery.testCode ? (`	Continues the surrounding declaration/expression or text: {delivery.testCode ? (. Read it with the preceding opening statement (/>); it is not a standalone business operation.

Line	Source code	Explanation / reading note
141	`<Text style={styles.testNote}>Local preview code: {delivery.testCode}</Text>`	Renders/opens a UI element or component: <Text style={styles.testNote}>Local preview code: {delivery.testCode}</Text>. Props and child content below determine appearance and interactions.
142	`) : null}`	Continues the surrounding declaration/expression or text:) : null}. Read it with the preceding opening statement (<Text style={styles.testNote}>Local preview code: {delivery.testCode}</Text>); it is not a standalone business operation.
143	`{!!error && <Text style={styles.errorText}>{error}</Text>}`	Assigns the right-hand expression to the named variable/property: {!!error && <Text style={styles.errorText}>{error}</Text>}. This is in-memory unless it is later persisted by an explicit call.
144	`<Button`	Renders/opens a UI element or component: <Button. Props and child content below determine appearance and interactions.
145	`title={busy ? "VERIFYING…" : "VERIFY & SIGN IN"}`	Assigns the right-hand expression to the named variable/property: title={busy ? "VERIFYING…" : "VERIFY & SIGN IN"}. This is in-memory unless it is later persisted by an explicit call.
146	`onPress={verifyCode}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
147	`disabled={busy || code.length !== 6}`	Controls whether this button/input accepts interaction. Evaluate this expression when diagnosing an unclickable control.
148	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (disabled={busy || code.length !== 6}); it is not a standalone business operation.
149	`<Text onPress={requestCode} style={styles.link}>`	Renders/opens a UI element or component: <Text onPress={requestCode} style={styles.link}>. Props and child content below determine appearance and interactions.
150	`Send a fresh code`	Continues the surrounding declaration/expression or text: Send a fresh code. Read it with the preceding opening statement (<Text onPress={requestCode} style={styles.link}>); it is not a standalone business operation.
151	`</Text>`	Closes the UI element/component opened above.
152	`<Text onPress={() => setDelivery(undefined)} style={styles.link}>`	Renders/opens a UI element or component: <Text onPress={() => setDelivery(undefined)} style={styles.link}>. Props and child content below determine appearance and interactions.

Line	Source code	Explanation / reading note
153	`Use a different email`	Continues the surrounding declaration/expression or text: Use a different email. Read it with the preceding opening statement (<Text onPress={() => setDelivery(undefined)} style={styles.link}>); it is not a standalone business operation.
154	`</Text>`	Closes the UI element/component opened above.
155	`</>`	Closes the UI element/component opened above.
156	`) : (`	Continues the surrounding declaration/expression or text:) : (. Read it with the preceding opening statement (</>); it is not a standalone business operation.
157	`<>`	Renders/opens a UI element or component: <>. Props and child content below determine appearance and interactions.
158	`<Button`	Renders/opens a UI element or component: <Button. Props and child content below determine appearance and interactions.
159	`title={busy ? "SENDING…" : "EMAIL MY SIGN-IN CODE"}`	Assigns the right-hand expression to the named variable/property: title={busy ? "SENDING…" : "EMAIL MY SIGN-IN CODE"}. This is in-memory unless it is later persisted by an explicit call.
160	`onPress={requestCode}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
161	`disabled={busy || !email.trim().includes("@")}`	Controls whether this button/input accepts interaction. Evaluate this expression when diagnosing an unclickable control.
162	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (disabled={busy || !email.trim().includes("@")}); it is not a standalone business operation.
163	`{!!error && <Text style={styles.errorText}>{error}</Text>}`	Assigns the right-hand expression to the named variable/property: {!!error && <Text style={styles.errorText}>{error}</Text>}. This is in-memory unless it is later persisted by an explicit call.
164	`<Text onPress={showCodeEntry} style={styles.link}>`	Renders/opens a UI element or component: <Text onPress={showCodeEntry} style={styles.link}>. Props and child content below determine appearance and interactions.
165	`I already received a code`	Continues the surrounding declaration/expression or text: I already received a code. Read it with the preceding opening statement (<Text onPress={showCodeEntry} style={styles.link}>); it is not a standalone business operation.

Line	Source code	Explanation / reading note
166	`</Text>`	Closes the UI element/component opened above.
167	`</>`	Closes the UI element/component opened above.
168	`)}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
169	`<Text style={styles.securityNote}>`	Renders/opens a UI element or component: <Text style={styles.securityNote}>. Props and child content below determine appearance and interactions.
170	`🔒 Your login determines exactly which beat and outlets you can access. Passwords are`	Continues the surrounding declaration/expression or text: 🔒 Your login determines exactly which beat and outlets you can access. Passwords are. Read it with the preceding opening statement (<Text style={styles.securityNote}>); it is not a standalone business operation.
171	`never stored in this application.`	Continues the surrounding declaration/expression or text: never stored in this application.. Read it with the preceding opening statement (🔒 Your login determines exactly which beat and outlets you can access. Passwords are); it is not a standalone business operation.
172	`</Text>`	Closes the UI element/component opened above.
173	`</View>`	Closes the UI element/component opened above.
174	`</KeyboardAvoidingView>`	Closes the UI element/component opened above.
175	`</SafeAreaView>`	Closes the UI element/component opened above.
176	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
177	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
178		Blank line separating logical sections; no executable operation.
179	`const styles = StyleSheet.create({`	Declares/initializes local data used by the surrounding operation: const styles = StyleSheet.create({. Collection contents and assignments below determine its purpose.
180	`root: { flex: 1, backgroundColor: "#F3F6FA" },`	Sets/declares the named object property or style/type member: root: { flex: 1, backgroundColor: "#F3F6FA" },. Interpret it in the enclosing object, props or type definition.
181	`content: { flex: 1, justifyContent: "center", padding: 20 },`	Sets/declares the named object property or style/type member: content: { flex: 1, justifyContent: "center", padding: 20 },. Interpret it in the enclosing object, props or type definition.

27	`productName: "Product",`	Sets/declares the named object property or style/type member: productName: "Product",. Interpret it in the enclosing object, props or type definition.

Line	Source code	Explanation / reading note
28	`};`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
29	`export default function ModuleListScreen({`	Declares a callable function/method: export default function ModuleListScreen({. Parameters supply its inputs; the following block implements the operation.
30	`  route,`	Continues the surrounding declaration/expression or text: route,. Read it with the preceding opening statement (export default function ModuleListScreen({); it is not a standalone business operation.
31	`}: NativeStackScreenProps<RootStack, "ModuleList">) {`	Continues the surrounding declaration/expression or text: }: NativeStackScreenProps<RootStack, "ModuleList">) {. Read it with the preceding opening statement (route,); it is not a standalone business operation.
32	`  const [rows, setRows] = useState<any[]>([]),`	Declares/uses React render state. Its setter schedules a re-render; it does not save a Salesforce record by itself.
33	`    [loading, setLoading] = useState(true),`	Declares/uses React render state. Its setter schedules a re-render; it does not save a Salesforce record by itself.
34	`    [error, setError] = useState("");`	Declares/uses React render state. Its setter schedules a re-render; it does not save a Salesforce record by itself.
35	`  const load = () => {`	Declares/initializes local data used by the surrounding operation: const load = () => {. Collection contents and assignments below determine its purpose.
36	`    setLoading(true);`	Continues the surrounding declaration/expression or text: setLoading(true);. Read it with the preceding opening statement (const load = () => {); it is not a standalone business operation.
37	`    setError("");`	Continues the surrounding declaration/expression or text: setError("");. Read it with the preceding opening statement (setLoading(true);); it is not a standalone business operation.
38	`    api<any[]>(`/modules/${route.params.moduleName}`)`	Continues the surrounding declaration/expression or text: api<any[]>(`/modules/${route.params.moduleName}`). Read it with the preceding opening statement (setError("");); it is not a standalone business operation.
39	`      .then(setRows)`	Continues the surrounding declaration/expression or text: .then(setRows). Read it with the preceding opening statement (api<any[]>(`/modules/${route.params.moduleName}`)); it is not a standalone business operation.

Line	Source code	Explanation / reading note
40	`.catch((e) => setError(e.message))`	Continues the surrounding declaration/expression or text: .catch((e) => setError(e.message)). Read it with the preceding opening statement (.then(setRows)); it is not a standalone business operation.
41	`.finally(() => setLoading(false));`	Continues the surrounding declaration/expression or text: .finally(() => setLoading(false));. Read it with the preceding opening statement (.catch((e) => setError(e.message))); it is not a standalone business operation.
42	`};`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
43	`useFocusEffect(useCallback(load, [route.params.moduleName]));`	Continues the surrounding declaration/expression or text: useFocusEffect(useCallback(load, [route.params.moduleName]));. Read it with the preceding opening statement (};); it is not a standalone business operation.
44	`return (`	Returns (to the caller (or begins returned UI markup) and ends this execution path.
45	`<ScrollView style={s.page} contentContainerStyle={s.content}>`	Renders/opens a UI element or component: <ScrollView style={s.page} contentContainerStyle={s.content}>. Props and child content below determine appearance and interactions.
46	`<Text style={s.title}>{route.params.title}</Text>`	Renders/opens a UI element or component: <Text style={s.title}>{route.params.title}</Text>. Props and child content below determine appearance and interactions.
47	`<Text style={s.sub}>Live Salesforce records for your outlets</Text>`	Renders/opens a UI element or component: <Text style={s.sub}>Live Salesforce records for your outlets</Text>. Props and child content below determine appearance and interactions.
48	`<Pressable accessibilityRole="button" onPress={load}>`	Renders/opens a UI element or component: <Pressable accessibilityRole="button" onPress={load}>. Props and child content below determine appearance and interactions.
49	`<Text style={s.retry}>REFRESH SALESFORCE RECORDS</Text>`	Renders/opens a UI element or component: <Text style={s.retry}>REFRESH SALESFORCE RECORDS</Text>. Props and child content below determine appearance and interactions.
50	`</Pressable>`	Closes the UI element/component opened above.
51	`{loading && <ActivityIndicator color={colors.brand} style={s.loader} />}{" "}`	Assigns the right-hand expression to the named variable/property: {loading && <ActivityIndicator color={colors.brand} style={s.loader} />}{" "}. This is in-memory unless it is later persisted by an explicit call.
52	`{!!error && (`	Continues the surrounding declaration/expression or text: {!!error && (. Read it with the preceding opening statement ({loading && <ActivityIndicator color={colors.brand} style={s.loader} />}{" "}); it is not a standalone business operation.

Line	Source code	Explanation / reading note
53	`<Pressable style={s.error} onPress={load}>`	Renders/opens a UI element or component: <Pressable style={s.error} onPress={load}>. Props and child content below determine appearance and interactions.
54	`<Text style={s.errorTitle}>{error}</Text>`	Renders/opens a UI element or component: <Text style={s.errorTitle}>{error}</Text>. Props and child content below determine appearance and interactions.
55	`<Text style={s.retry}>TAP TO RETRY</Text>`	Renders/opens a UI element or component: <Text style={s.retry}>TAP TO RETRY</Text>. Props and child content below determine appearance and interactions.
56	`</Pressable>`	Closes the UI element/component opened above.
57	`)}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
58	`{!loading && !error && !rows.length && (`	Continues the surrounding declaration/expression or text: {!loading && !error && !rows.length && (. Read it with the preceding opening statement ( )}); it is not a standalone business operation.
59	`<View style={s.empty}>`	Renders/opens a UI element or component: <View style={s.empty}>. Props and child content below determine appearance and interactions.
60	`<Text style={s.recordTitle}>No records found</Text>`	Renders/opens a UI element or component: <Text style={s.recordTitle}>No records found</Text>. Props and child content below determine appearance and interactions.
61	`<Text style={s.sub}>Records created from outlet visits will appear here.</Text>`	Renders/opens a UI element or component: <Text style={s.sub}>Records created from outlet visits will appear here.</Text>. Props and child content below determine appearance and interactions.
62	`</View>`	Closes the UI element/component opened above.
63	`)}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
64	`{rows.map((row) => (`	Transforms/selects/aggregates collection values with the callback shown here: {rows.map((row) => (. Read the callback body and result assignment together.
65	`<View key={row.Id} style={s.card}>`	Renders/opens a UI element or component: <View key={row.Id} style={s.card}>. Props and child content below determine appearance and interactions.
66	`<Text style={s.recordTitle}>{row.Name || row.Subject__c || "Salesforce record"}</Text>`	Renders/opens a UI element or component: <Text style={s.recordTitle}>{row.Name || row.Subject__c || "Salesforce record"}</Text>. Props and child content below determine appearance and interactions.

Line	Source code	Explanation / reading note
67	`{Object.entries(row)`	Calls the named method: {Object.entries(row). Its implementation defines the side effect/result; use the symbol/file index to follow it.
68	`.filter(`	Transforms/selects/aggregates collection values with the callback shown here: .filter(. Read the callback body and result assignment together.
69	`([key, value]) =>`	Continues the surrounding declaration/expression or text: ([key, value]) =>. Read it with the preceding opening statement (.filter(); it is not a standalone business operation.
70	`key !== "Id" &&`	Continues the surrounding declaration/expression or text: key !== "Id" &&. Read it with the preceding opening statement (([key, value]) =>); it is not a standalone business operation.
71	`key !== "Name" &&`	Continues the surrounding declaration/expression or text: key !== "Name" &&. Read it with the preceding opening statement (key !== "Id" &&); it is not a standalone business operation.
72	`value !== null &&`	Continues the surrounding declaration/expression or text: value !== null &&. Read it with the preceding opening statement (key !== "Name" &&); it is not a standalone business operation.
73	`value !== undefined &&`	Continues the surrounding declaration/expression or text: value !== undefined &&. Read it with the preceding opening statement (value !== null &&); it is not a standalone business operation.
74	`value !== "",`	Continues the surrounding declaration/expression or text: value !== "",. Read it with the preceding opening statement (value !== undefined &&); it is not a standalone business operation.
75	`)`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
76	`.map(([key, value]) => (`	Transforms/selects/aggregates collection values with the callback shown here: .map(([key, value]) => (. Read the callback body and result assignment together.
77	`<View key={key} style={s.field}>`	Renders/opens a UI element or component: <View key={key} style={s.field}>. Props and child content below determine appearance and interactions.
78	`<Text style={s.label}>`	Renders/opens a UI element or component: <Text style={s.label}>. Props and child content below determine appearance and interactions.
79	`{labels[key] || key.replace(/__c$/, "").replaceAll("_", " ")}`	Calls the named method: {labels[key] || key.replace(/__c$/, "").replaceAll("_", " ")}. Its implementation defines the side effect/result; use the symbol/file index to follow it.

Line	Source code	Explanation / reading note
80	`</Text>`	Closes the UI element/component opened above.
81	`<Text style={s.value}>`	Renders/opens a UI element or component: <Text style={s.value}>. Props and child content below determine appearance and interactions.
82	`{typeof value === "number" && ["MRP__c", "RBP__c"].includes(key)`	Continues the surrounding declaration/expression or text: {typeof value === "number" && ["MRP__c", "RBP__c"].includes(key). Read it with the preceding opening statement (<Text style={s.value}>); it is not a standalone business operation.
83	`? `₹${value}``	Continues the surrounding declaration/expression or text: ? `₹${value}`. Read it with the preceding opening statement ({typeof value === "number" && ["MRP__c", "RBP__c"].includes(key)); it is not a standalone business operation.
84	`: String(value)}`	Continues the surrounding declaration/expression or text: : String(value)}. Read it with the preceding opening statement (? `₹${value}`); it is not a standalone business operation.
85	`</Text>`	Closes the UI element/component opened above.
86	`</View>`	Closes the UI element/component opened above.
87	`))}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
88	`</View>`	Closes the UI element/component opened above.
89	`))}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
90	`</ScrollView>`	Closes the UI element/component opened above.

43	`    try {`	Starts operations whose failure is handled by the following catch/finally blocks.
44	`      setOutlets(await api<Store[]>("/outlets"));`	Waits for this asynchronous operation before continuing: setOutlets(await api<Store[]>("/outlets"));. The returned result/error must still be handled.
45	`    } catch (reason: any) {`	Handles an exception from the preceding try block. Check whether it rolls back, preserves queued work or only displays an error.
46	`      setError(reason.message || "Unable to load outlets");`	Continues the surrounding declaration/expression or text: setError(reason.message || "Unable to load outlets");. Read it with the preceding opening statement (} catch (reason: any) {); it is not a standalone business operation.
47	`    } finally {`	Cleanup section that runs after success or failure, for example clearing a timer or busy flag.
48	`      setLoading(false);`	Continues the surrounding declaration/expression or text: setLoading(false);. Read it with the preceding opening statement (} finally {); it is not a standalone business operation.
49	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
50	`  };`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
51	`  useEffect(() => {`	Registers a lifecycle effect. Read its dependency array and cleanup to understand when it runs or is cancelled.
52	`    loadOutlets();`	Continues the surrounding declaration/expression or text: loadOutlets();. Read it with the preceding opening statement (useEffect(() => {); it is not a standalone business operation.
53	`  }, []);`	Continues the surrounding declaration/expression or text: }, []);. Read it with the preceding opening statement (loadOutlets();); it is not a standalone business operation.
54		Blank line separating logical sections; no executable operation.
55	`  const beats = useMemo(`	Caches a derived value using the listed dependencies, such as filtered products or totals.

Line	Source code	Explanation / reading note
56	`() => ["All Beats", ...Array.from(new Set(outlets.map((row) => row.beatName).filter(Boolean)))],`	Transforms/selects/aggregates collection values with the callback shown here: () => ["All Beats", ...Array.from(new Set(outlets.map((row) => row.beatName).filter(Boolean)))],. Read the callback body and result assignment together.
57	`[outlets],`	Continues the surrounding declaration/expression or text: [outlets],. Read it with the preceding opening statement (() => ["All Beats", ...Array.from(new Set(outlets.map((row) => row.beatName).filter(Boolean)))],); it is not a standalone business operation.
58	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
59	`const visible = useMemo(() => {`	Caches a derived value using the listed dependencies, such as filtered products or totals.
60	`const text = query.trim().toLowerCase();`	Declares/initializes local data used by the surrounding operation: const text = query.trim().toLowerCase();. Collection contents and assignments below determine its purpose.
61	`return outlets.filter((outlet) => {`	Returns outlets.filter((outlet) => { to the caller (or begins returned UI markup) and ends this execution path.
62	`const matchesSearch =`	Declares/initializes local data used by the surrounding operation: const matchesSearch =. Collection contents and assignments below determine its purpose.
63	`` `${outlet.name} ${outlet.code} ${outlet.owner || ""} ${outlet.contact || outlet.phone || ""}` ``	Continues the surrounding declaration/expression or text: `${outlet.name} ${outlet.code} ${outlet.owner || ""} ${outlet.contact || outlet.phone || ""}`. Read it with the preceding opening statement (const matchesSearch =); it is not a standalone business operation.
64	`.toLowerCase()`	Continues the surrounding declaration/expression or text: .toLowerCase(). Read it with the preceding opening statement (`${outlet.name} ${outlet.code} ${outlet.owner || ""} ${outlet.contact || outlet.phone || ""}`); it is not a standalone business operation.
65	`.includes(text);`	Continues the surrounding declaration/expression or text: .includes(text);. Read it with the preceding opening statement (.toLowerCase()); it is not a standalone business operation.
66	`return matchesSearch && (selectedBeat === "All Beats" || outlet.beatName === selectedBeat);`	Returns matchesSearch && (selectedBeat === "All Beats" || outlet.beatName === selectedBeat) to the caller (or begins returned UI markup) and ends this execution path.
67	`});`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
68	`}, [outlets, query, selectedBeat]);`	Continues the surrounding declaration/expression or text: }, [outlets, query, selectedBeat]);. Read it with the preceding opening statement (});); it is not a standalone business operation.

Line	Source code	Explanation / reading note
69		Blank line separating logical sections; no executable operation.
70	`  return (`	Returns (to the caller (or begins returned UI markup) and ends this execution path.
71	`    <SafeAreaView style={s.safe}>`	Renders/opens a UI element or component: <SafeAreaView style={s.safe}>. Props and child content below determine appearance and interactions.
72	`      <View style={s.shell}>`	Renders/opens a UI element or component: <View style={s.shell}>. Props and child content below determine appearance and interactions.
73	`        <BrandHeader />`	Renders/opens a UI element or component: <BrandHeader />. Props and child content below determine appearance and interactions.
74	`        <ScrollView style={s.page} contentContainerStyle={s.content}>`	Renders/opens a UI element or component: <ScrollView style={s.page} contentContainerStyle={s.content}>. Props and child content below determine appearance and interactions.
75	`          <View style={s.top}>`	Renders/opens a UI element or component: <View style={s.top}>. Props and child content below determine appearance and interactions.
76	`            <View>`	Renders/opens a UI element or component: <View>. Props and child content below determine appearance and interactions.
77	`              <Text style={s.title}>MY OUTLETS</Text>`	Renders/opens a UI element or component: <Text style={s.title}>MY OUTLETS</Text>. Props and child content below determine appearance and interactions.
78	`              <Text style={s.muted}>{outlets.length} Outlets Assigned to You</Text>`	Renders/opens a UI element or component: <Text style={s.muted}>{outlets.length} Outlets Assigned to You</Text>. Props and child content below determine appearance and interactions.
79	`            </View>`	Closes the UI element/component opened above.
80	`            <Pressable style={s.map} onPress={() => navigation.navigate("OutletMap")}>`	Renders/opens a UI element or component: <Pressable style={s.map} onPress={() => navigation.navigate("OutletMap")}>. Props and child content below determine appearance and interactions.
81	`              <Text style={s.mapText}>➤ Map View</Text>`	Renders/opens a UI element or component: <Text style={s.mapText}>➤ Map View</Text>. Props and child content below determine appearance and interactions.
82	`            </Pressable>`	Closes the UI element/component opened above.
83	`          </View>`	Closes the UI element/component opened above.

Line	Source code	Explanation / reading note
84	`<TextInput`	Renders/opens a UI element or component: <TextInput. Props and child content below determine appearance and interactions.
85	`value={query}`	Assigns the right-hand expression to the named variable/property: value={query}. This is in-memory unless it is later persisted by an explicit call.
86	`onChangeText={setQuery}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
87	`placeholder="Search outlet, code, owner, phone..."`	Assigns the right-hand expression to the named variable/property: placeholder="Search outlet, code, owner, phone...". This is in-memory unless it is later persisted by an explicit call.
88	`style={s.search}`	Assigns the right-hand expression to the named variable/property: style={s.search}. This is in-memory unless it is later persisted by an explicit call.
89	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (style={s.search}); it is not a standalone business operation.
90	`<ScrollView`	Renders/opens a UI element or component: <ScrollView. Props and child content below determine appearance and interactions.
91	`horizontal`	Continues the surrounding declaration/expression or text: horizontal. Read it with the preceding opening statement (<ScrollView); it is not a standalone business operation.
92	`showsHorizontalScrollIndicator={false}`	Assigns the right-hand expression to the named variable/property: showsHorizontalScrollIndicator={false}. This is in-memory unless it is later persisted by an explicit call.
93	`contentContainerStyle={s.chips}`	Assigns the right-hand expression to the named variable/property: contentContainerStyle={s.chips}. This is in-memory unless it is later persisted by an explicit call.
94	`>`	Continues the surrounding declaration/expression or text: >. Read it with the preceding opening statement (contentContainerStyle={s.chips}); it is not a standalone business operation.
95	`{beats.map((beat) => (`	Transforms/selects/aggregates collection values with the callback shown here: {beats.map((beat) => (. Read the callback body and result assignment together.
96	`<Pressable`	Renders/opens a UI element or component: <Pressable. Props and child content below determine appearance and interactions.

Line	Source code	Explanation / reading note
97	`key={beat}`	Assigns the right-hand expression to the named variable/property: key={beat}. This is in-memory unless it is later persisted by an explicit call.
98	`onPress={() => setSelectedBeat(beat || "All Beats")}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
99	`style={[s.chip, selectedBeat === beat && s.chipOn]}`	Assigns the right-hand expression to the named variable/property: style={[s.chip, selectedBeat === beat && s.chipOn]}. This is in-memory unless it is later persisted by an explicit call.
100	`>`	Continues the surrounding declaration/expression or text: >. Read it with the preceding opening statement (style={[s.chip, selectedBeat === beat && s.chipOn]}); it is not a standalone business operation.
101	`<Text style={[s.chipText, selectedBeat === beat && s.chipTextOn]}>{beat}</Text>`	Renders/opens a UI element or component: <Text style={[s.chipText, selectedBeat === beat && s.chipTextOn]}>{beat}</Text>. Props and child content below determine appearance and interactions.
102	`</Pressable>`	Closes the UI element/component opened above.
103	`))}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
104	`</ScrollView>`	Closes the UI element/component opened above.
105	`{loading && (`	Continues the surrounding declaration/expression or text: {loading && (. Read it with the preceding opening statement (</ScrollView>); it is not a standalone business operation.
106	`<View style={s.state}>`	Renders/opens a UI element or component: <View style={s.state}>. Props and child content below determine appearance and interactions.
107	`<ActivityIndicator color={colors.brand} />`	Renders/opens a UI element or component: <ActivityIndicator color={colors.brand} />. Props and child content below determine appearance and interactions.
108	`<Text style={s.muted}>Loading Salesforce outlets…</Text>`	Renders/opens a UI element or component: <Text style={s.muted}>Loading Salesforce outlets…</Text>. Props and child content below determine appearance and interactions.
109	`</View>`	Closes the UI element/component opened above.
110	`)}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

27	`  async function load() {`	Declares a callable function/method: async function load() {. Parameters supply its inputs; the following block implements the operation.

Line	Source code	Explanation / reading note
28	`    setBusy(true);`	Continues the surrounding declaration/expression or text: setBusy(true);. Read it with the preceding opening statement (async function load() {); it is not a standalone business operation.
29	`    try {`	Starts operations whose failure is handled by the following catch/finally blocks.
30	`      const id = await employeeId();`	Waits for this asynchronous operation before continuing: const id = await employeeId();. The returned result/error must still be handled.
31	`      setOwner(id);`	Continues the surrounding declaration/expression or text: setOwner(id);. Read it with the preceding opening statement (const id = await employeeId();); it is not a standalone business operation.
32	`      setPending(await primaryPending(id));`	Waits for this asynchronous operation before continuing: setPending(await primaryPending(id));. The returned result/error must still be handled.
33	`      setData(await api("/primary/catalogue"));`	Waits for this asynchronous operation before continuing: setData(await api("/primary/catalogue"));. The returned result/error must still be handled.
34	`    } catch (error: any) {`	Handles an exception from the preceding try block. Check whether it rolls back, preserves queued work or only displays an error.
35	`      setMessage(error.message);`	Continues the surrounding declaration/expression or text: setMessage(error.message);. Read it with the preceding opening statement (} catch (error: any) {); it is not a standalone business operation.
36	`    } finally {`	Cleanup section that runs after success or failure, for example clearing a timer or busy flag.
37	`      setBusy(false);`	Continues the surrounding declaration/expression or text: setBusy(false);. Read it with the preceding opening statement (} finally {); it is not a standalone business operation.
38	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
39	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
40	`  useEffect(() => {`	Registers a lifecycle effect. Read its dependency array and cleanup to understand when it runs or is cancelled.
41	`    void load();`	Continues the surrounding declaration/expression or text: void load();. Read it with the preceding opening statement (useEffect(() => {); it is not a standalone business operation.

Line	Source code	Explanation / reading note
42	`}, []);`	Continues the surrounding declaration/expression or text: }, []);. Read it with the preceding opening statement (void load();); it is not a standalone business operation.
43	`async function synchronize() {`	Declares a callable function/method: async function synchronize() {. Parameters supply its inputs; the following block implements the operation.
44	`  setBusy(true);`	Continues the surrounding declaration/expression or text: setBusy(true);. Read it with the preceding opening statement (async function synchronize() {); it is not a standalone business operation.
45	`  try {`	Starts operations whose failure is handled by the following catch/finally blocks.
46	`    await syncPrimary(owner);`	Waits for this asynchronous operation before continuing: await syncPrimary(owner);. The returned result/error must still be handled.
47	`    setMessage("Synchronization finished. Check the Salesforce status below.");`	Continues the surrounding declaration/expression or text: setMessage("Synchronization finished. Check the Salesforce status below.");. Read it with the preceding opening statement (await syncPrimary(owner);); it is not a standalone business operation.
48	`  } catch (error: any) {`	Handles an exception from the preceding try block. Check whether it rolls back, preserves queued work or only displays an error.
49	`    setMessage(error.message);`	Continues the surrounding declaration/expression or text: setMessage(error.message);. Read it with the preceding opening statement (} catch (error: any) {); it is not a standalone business operation.
50	`  } finally {`	Cleanup section that runs after success or failure, for example clearing a timer or busy flag.
51	`    setPending(await primaryPending(owner));`	Waits for this asynchronous operation before continuing: setPending(await primaryPending(owner));. The returned result/error must still be handled.
52	`    setBusy(false);`	Continues the surrounding declaration/expression or text: setBusy(false);. Read it with the preceding opening statement (setPending(await primaryPending(owner));); it is not a standalone business operation.
53	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
54	`  await load();`	Waits for this asynchronous operation before continuing: await load();. The returned result/error must still be handled.

Line	Source code	Explanation / reading note
55	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
56	`  async function save() {`	Declares a callable function/method: async function save() {. Parameters supply its inputs; the following block implements the operation.
57	`    setBusy(true);`	Continues the surrounding declaration/expression or text: setBusy(true);. Read it with the preceding opening statement (async function save() {); it is not a standalone business operation.
58	`    try {`	Starts operations whose failure is handled by the following catch/finally blocks.
59	`      const lines = Object.entries(quantities)`	Declares/initializes local data used by the surrounding operation: const lines = Object.entries(quantities). Collection contents and assignments below determine its purpose.
60	`        .filter(([, value]) => Number(value) > 0)`	Transforms/selects/aggregates collection values with the callback shown here: .filter(([, value]) => Number(value) > 0). Read the callback body and result assignment together.
61	`        .map(([id, value]) =>`	Transforms/selects/aggregates collection values with the callback shown here: .map(([id, value]) =>. Read the callback body and result assignment together.
62	`          mode === "primaryOrder"`	Continues the surrounding declaration/expression or text: mode === "primaryOrder". Read it with the preceding opening statement (.map(([id, value]) =>); it is not a standalone business operation.

68	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
69	`} catch (e: any) {`	Handles an exception from the preceding try block. Check whether it rolls back, preserves queued work or only displays an error.
70	`setMessage(e.message || "Location validation failed.");`	Continues the surrounding declaration/expression or text: setMessage(e.message || "Location validation failed.");. Read it with the preceding opening statement (} catch (e: any) {); it is not a standalone business operation.
71	`Alert.alert("Location unavailable", e.message);`	Calls the named method: Alert.alert("Location unavailable", e.message);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
72	`} finally {`	Cleanup section that runs after success or failure, for example clearing a timer or busy flag.
73	`setBusy(false);`	Continues the surrounding declaration/expression or text: setBusy(false);. Read it with the preceding opening statement (} finally {); it is not a standalone business operation.
74	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
75	`};`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
76	`const saveMissedStatus = async (status: "Not Visited" | "Not Available") => {`	Declares/initializes local data used by the surrounding operation: const saveMissedStatus = async (status: "Not Visited" | "Not Available") => {. Collection contents and assignments below determine its purpose.
77	`try {`	Starts operations whose failure is handled by the following catch/finally blocks.
78	`setBusy(true);`	Continues the surrounding declaration/expression or text: setBusy(true);. Read it with the preceding opening statement (try {); it is not a standalone business operation.

Line	Source code	Explanation / reading note
79	`      await post(`/outlets/${store.id}/visit-status`, { status });`	Waits for this asynchronous operation before continuing: await post(`/outlets/${store.id}/visit-status`, { status });. The returned result/error must still be handled.
80	`      setMessage(`${status} saved in Salesforce`);`	Continues the surrounding declaration/expression or text: setMessage(`${status} saved in Salesforce`);. Read it with the preceding opening statement (await post(`/outlets/${store.id}/visit-status`, { status });); it is not a standalone business operation.
81	`      Alert.alert("Saved", `${status} was recorded for ${store.name}.`);`	Calls the named method: Alert.alert("Saved", `${status} was recorded for ${store.name}.`);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
82	`    } catch (error: any) {`	Handles an exception from the preceding try block. Check whether it rolls back, preserves queued work or only displays an error.
83	`      Alert.alert("Unable to save", error.message);`	Calls the named method: Alert.alert("Unable to save", error.message);. Its implementation defines the side effect/result; use the symbol/file index to follow it.
84	`    } finally {`	Cleanup section that runs after success or failure, for example clearing a timer or busy flag.
85	`      setBusy(false);`	Continues the surrounding declaration/expression or text: setBusy(false);. Read it with the preceding opening statement (} finally {); it is not a standalone business operation.
86	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
87	`  };`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
88	`  return (`	Returns (to the caller (or begins returned UI markup) and ends this execution path.
89	`    <ScrollView style={s.root} contentContainerStyle={s.content}>`	Renders/opens a UI element or component: <ScrollView style={s.root} contentContainerStyle={s.content}>. Props and child content below determine appearance and interactions.
90	`      <Card>`	Renders/opens a UI element or component: <Card>. Props and child content below determine appearance and interactions.
91	`        <View style={s.top}>`	Renders/opens a UI element or component: <View style={s.top}>. Props and child content below determine appearance and interactions.
92	`          <Label>ACTIVE OUTLET</Label>`	Renders/opens a UI element or component: <Label>ACTIVE OUTLET</Label>. Props and child content below determine appearance and interactions.

7	`import type { RootStack, Store } from "../types";`	Imports dependencies/types used below: import type { RootStack, Store } from "../types";. Importing a function does not call it.
8	`export default function StoresScreen({`	Declares a callable function/method: export default function StoresScreen({. Parameters supply its inputs; the following block implements the operation.
9	`  route,`	Continues the surrounding declaration/expression or text: route,. Read it with the preceding opening statement (export default function StoresScreen({); it is not a standalone business operation.
10	`  navigation,`	Continues the surrounding declaration/expression or text: navigation,. Read it with the preceding opening statement (route,); it is not a standalone business operation.
11	`}: NativeStackScreenProps<RootStack, "Stores">) {`	Continues the surrounding declaration/expression or text: }: NativeStackScreenProps<RootStack, "Stores">) {. Read it with the preceding opening statement (navigation,); it is not a standalone business operation.

Line	Source code	Explanation / reading note
12	`  const [stores, setStores] = useState<Store[]>([]),`	Declares/uses React render state. Its setter schedules a re-render; it does not save a Salesforce record by itself.
13	`    [filter, setFilter] = useState("All"),`	Declares/uses React render state. Its setter schedules a re-render; it does not save a Salesforce record by itself.
14	`    [search, setSearch] = useState("");`	Declares/uses React render state. Its setter schedules a re-render; it does not save a Salesforce record by itself.
15	`  useEffect(() => {`	Registers a lifecycle effect. Read its dependency array and cleanup to understand when it runs or is cancelled.
16	`    api<Store[]>(`/beats/${route.params.beat.id}/stores`)`	Continues the surrounding declaration/expression or text: api<Store[]>(`/beats/${route.params.beat.id}/stores`). Read it with the preceding opening statement (useEffect(() => {); it is not a standalone business operation.
17	`      .then(setStores)`	Continues the surrounding declaration/expression or text: .then(setStores). Read it with the preceding opening statement (api<Store[]>(`/beats/${route.params.beat.id}/stores`)); it is not a standalone business operation.
18	`      .catch((e) => Alert.alert("Unable to load outlets", e.message));`	Calls the named method: .catch((e) => Alert.alert("Unable to load outlets", e.message));. Its implementation defines the side effect/result; use the symbol/file index to follow it.
19	`  }, []);`	Continues the surrounding declaration/expression or text: }, []);. Read it with the preceding opening statement (.catch((e) => Alert.alert("Unable to load outlets", e.message));); it is not a standalone business operation.
20	`  const visible = stores.filter(`	Declares/initializes local data used by the surrounding operation: const visible = stores.filter(. Collection contents and assignments below determine its purpose.
21	`    (x) =>`	Continues the surrounding declaration/expression or text: (x) =>. Read it with the preceding opening statement (const visible = stores.filter(); it is not a standalone business operation.
22	`      (filter === "All" || x.status === filter) &&`	Continues the surrounding declaration/expression or text: (filter === "All" || x.status === filter) &&. Read it with the preceding opening statement ((x) =>); it is not a standalone business operation.
23	`      x.name.toLowerCase().includes(search.toLowerCase()),`	Calls the named method: x.name.toLowerCase().includes(search.toLowerCase()),. Its implementation defines the side effect/result; use the symbol/file index to follow it.
24	`  );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

Line	Source code	Explanation / reading note
25	`  return (`	Returns (to the caller (or begins returned UI markup) and ends this execution path.
26	`    <View style={s.root}>`	Renders/opens a UI element or component: <View style={s.root}>. Props and child content below determine appearance and interactions.
27	`      <Label>{route.params.beat.name}</Label>`	Renders/opens a UI element or component: <Label>{route.params.beat.name}</Label>. Props and child content below determine appearance and interactions.
28	`      <Text style={s.heading}>Choose an outlet</Text>`	Renders/opens a UI element or component: <Text style={s.heading}>Choose an outlet</Text>. Props and child content below determine appearance and interactions.
29	`      <TextInput`	Renders/opens a UI element or component: <TextInput. Props and child content below determine appearance and interactions.
30	`        style={s.search}`	Assigns the right-hand expression to the named variable/property: style={s.search}. This is in-memory unless it is later persisted by an explicit call.
31	`        placeholder="Search outlet"`	Assigns the right-hand expression to the named variable/property: placeholder="Search outlet". This is in-memory unless it is later persisted by an explicit call.
32	`        value={search}`	Assigns the right-hand expression to the named variable/property: value={search}. This is in-memory unless it is later persisted by an explicit call.
33	`        onChangeText={setSearch}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
34	`      />`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (onChangeText={setSearch}); it is not a standalone business operation.
35	`      <View style={s.filters}>`	Renders/opens a UI element or component: <View style={s.filters}>. Props and child content below determine appearance and interactions.
36	`        {["All", "Pending", "Completed", "Not Visited"].map((x) => (`	Transforms/selects/aggregates collection values with the callback shown here: {["All", "Pending", "Completed", "Not Visited"].map((x) => (. Read the callback body and result assignment together.
37	`          <Pressable`	Renders/opens a UI element or component: <Pressable. Props and child content below determine appearance and interactions.
38	`            key={x}`	Assigns the right-hand expression to the named variable/property: key={x}. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
39	`onPress={() => setFilter(x)}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
40	`style={[s.chip, filter === x && s.active]}`	Assigns the right-hand expression to the named variable/property: style={[s.chip, filter === x && s.active]}. This is in-memory unless it is later persisted by an explicit call.
41	`>`	Continues the surrounding declaration/expression or text: >. Read it with the preceding opening statement (style={[s.chip, filter === x && s.active]}); it is not a standalone business operation.
42	`<Text style={filter === x && { color: "white" }}>{x}</Text>`	Renders/opens a UI element or component: <Text style={filter === x && { color: "white" }}>{x}</Text>. Props and child content below determine appearance and interactions.
43	`</Pressable>`	Closes the UI element/component opened above.
44	`))}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
45	`</View>`	Closes the UI element/component opened above.
46	`<FlatList`	Renders/opens a UI element or component: <FlatList. Props and child content below determine appearance and interactions.
47	`data={visible}`	Assigns the right-hand expression to the named variable/property: data={visible}. This is in-memory unless it is later persisted by an explicit call.
48	`keyExtractor={(x) => x.id}`	Assigns the right-hand expression to the named variable/property: keyExtractor={(x) => x.id}. This is in-memory unless it is later persisted by an explicit call.
49	`renderItem={({ item }) => (`	Assigns the right-hand expression to the named variable/property: renderItem={({ item }) => (. This is in-memory unless it is later persisted by an explicit call.
50	`<Card>`	Renders/opens a UI element or component: <Card>. Props and child content below determine appearance and interactions.
51	`<View style={s.between}>`	Renders/opens a UI element or component: <View style={s.between}>. Props and child content below determine appearance and interactions.
52	`<Text style={s.name}>{item.name}</Text>`	Renders/opens a UI element or component: <Text style={s.name}>{item.name}</Text>. Props and child content below determine appearance and interactions.
53	`<Text style={s.badge}>{item.status}</Text>`	Renders/opens a UI element or component: <Text style={s.badge}>{item.status}</Text>. Props and child content below determine appearance and interactions.

Line	Source code	Explanation / reading note
54	`</View>`	Closes the UI element/component opened above.
55	`<Text style={s.sub}>`	Renders/opens a UI element or component: <Text style={s.sub}>. Props and child content below determine appearance and interactions.
56	`{item.code} · {item.contact}`	Continues the surrounding declaration/expression or text: {item.code} · {item.contact}. Read it with the preceding opening statement (<Text style={s.sub}>); it is not a standalone business operation.
57	`</Text>`	Closes the UI element/component opened above.
58	`<Text style={s.sub}>{item.address}</Text>`	Renders/opens a UI element or component: <Text style={s.sub}>{item.address}</Text>. Props and child content below determine appearance and interactions.
59	`<View style={s.history}>`	Renders/opens a UI element or component: <View style={s.history}>. Props and child content below determine appearance and interactions.
60	`<View>`	Renders/opens a UI element or component: <View>. Props and child content below determine appearance and interactions.
61	`<Label>Last Visit</Label>`	Renders/opens a UI element or component: <Label>Last Visit</Label>. Props and child content below determine appearance and interactions.
62	`<Text>{item.lastVisit}</Text>`	Renders/opens a UI element or component: <Text>{item.lastVisit}</Text>. Props and child content below determine appearance and interactions.
63	`</View>`	Closes the UI element/component opened above.
64	`<View>`	Renders/opens a UI element or component: <View>. Props and child content below determine appearance and interactions.
65	`<Label>Last Order</Label>`	Renders/opens a UI element or component: <Label>Last Order</Label>. Props and child content below determine appearance and interactions.
66	`<Money value={item.lastOrder} />`	Renders/opens a UI element or component: <Money value={item.lastOrder} />. Props and child content below determine appearance and interactions.
67	`</View>`	Closes the UI element/component opened above.
68	`</View>`	Closes the UI element/component opened above.
69	`<Button`	Renders/opens a UI element or component: <Button. Props and child content below determine appearance and interactions.

Line	Source code	Explanation / reading note
70	`title="VISIT OUTLET"`	Assigns the right-hand expression to the named variable/property: title="VISIT OUTLET". This is in-memory unless it is later persisted by an explicit call.
71	`onPress={() => navigation.navigate("StoreGate", { store: item })}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
72	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (onPress={() => navigation.navigate("StoreGate", { store: item })}); it is not a standalone business operation.
73	`</Card>`	Closes the UI element/component opened above.
74	`)}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
75	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement ( )}); it is not a standalone business operation.

214	`{[1, 2, 3, 4, 5].map((value) => (`	Transforms/selects/aggregates collection values with the callback shown here: {[1, 2, 3, 4, 5].map((value) => (. Read the callback body and result assignment together.
215	`<Pressable key={value} onPress={() => setAnswer(question.id, String(value))}>`	Renders/opens a UI element or component: <Pressable key={value} onPress={() => setAnswer(question.id, String(value))}>. Props and child content below determine appearance and interactions.
216	`<Text`	Renders/opens a UI element or component: <Text. Props and child content below determine appearance and interactions.
217	`style={[s.star, value <= Number(answers[question.id] || 0) && s.starOn]}`	Assigns the right-hand expression to the named variable/property: style={[s.star, value <= Number(answers[question.id] || 0) && s.starOn]}. This is in-memory unless it is later persisted by an explicit call.
218	`>`	Continues the surrounding declaration/expression or text: >. Read it with the preceding opening statement (style={[s.star, value <= Number(answers[question.id] || 0) && s.starOn]}); it is not a standalone business operation.

Line	Source code	Explanation / reading note
219	★	Continues the surrounding declaration/expression or text: ★. Read it with the preceding opening statement (>); it is not a standalone business operation.
220	</Text>	Closes the UI element/component opened above.
221	</Pressable>	Closes the UI element/component opened above.
222	))}	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
223	</View>	Closes the UI element/component opened above.
224	) : (	Continues the surrounding declaration/expression or text:) : (. Read it with the preceding opening statement (</View>); it is not a standalone business operation.
225	<TextInput	Renders/opens a UI element or component: <TextInput. Props and child content below determine appearance and interactions.
226	style={s.input}	Assigns the right-hand expression to the named variable/property: style={s.input}. This is in-memory unless it is later persisted by an explicit call.
227	value={String(answers[question.id] || "")}	Assigns the right-hand expression to the named variable/property: value={String(answers[question.id] || "")}. This is in-memory unless it is later persisted by an explicit call.
228	onChangeText={(value) => setAnswer(question.id, value)}	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
229	keyboardType={	Assigns the right-hand expression to the named variable/property: keyboardType={. This is in-memory unless it is later persisted by an explicit call.
230	question.type === "Number" || question.type === "Phone"	Continues the surrounding declaration/expression or text: question.type === "Number" || question.type === "Phone". Read it with the preceding opening statement (keyboardType={); it is not a standalone business operation.
231	? "phone-pad"	Continues the surrounding declaration/expression or text: ? "phone-pad". Read it with the preceding opening statement (question.type === "Number" || question.type === "Phone"); it is not a standalone business operation.
232	: "default"	Continues the surrounding declaration/expression or text: : "default". Read it with the preceding opening statement (? "phone-pad"); it is not a standalone business operation.

Line	Source code	Explanation / reading note
233	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
234	`placeholder={`Enter ${question.type.toLowerCase()} answer`}`	Calls the named method: placeholder={`Enter ${question.type.toLowerCase()} answer`}. Its implementation defines the side effect/result; use the symbol/file index to follow it.
235	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (placeholder={`Enter ${question.type.toLowerCase()} answer`}); it is not a standalone business operation.
236	`)}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
237	`</View>`	Closes the UI element/component opened above.
238	`))}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
239	`<Label>REMARKS</Label>`	Renders/opens a UI element or component: <Label>REMARKS</Label>. Props and child content below determine appearance and interactions.
240	`<TextInput`	Renders/opens a UI element or component: <TextInput. Props and child content below determine appearance and interactions.
241	`style={[s.input, s.notes]}`	Assigns the right-hand expression to the named variable/property: style={[s.input, s.notes]}. This is in-memory unless it is later persisted by an explicit call.
242	`value={remarks}`	Assigns the right-hand expression to the named variable/property: value={remarks}. This is in-memory unless it is later persisted by an explicit call.
243	`onChangeText={setRemarks}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
244	`multiline`	Continues the surrounding declaration/expression or text: multiline. Read it with the preceding opening statement (onChangeText={setRemarks}); it is not a standalone business operation.
245	`placeholder="Survey remarks"`	Assigns the right-hand expression to the named variable/property: placeholder="Survey remarks". This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
246	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (placeholder="Survey remarks"); it is not a standalone business operation.
247	`<Button`	Renders/opens a UI element or component: <Button. Props and child content below determine appearance and interactions.
248	`title="SAVE DRAFT"`	Assigns the right-hand expression to the named variable/property: title="SAVE DRAFT". This is in-memory unless it is later persisted by an explicit call.
249	`kind="secondary"`	Assigns the right-hand expression to the named variable/property: kind="secondary". This is in-memory unless it is later persisted by an explicit call.
250	`disabled={saving}`	Controls whether this button/input accepts interaction. Evaluate this expression when diagnosing an unclickable control.
251	`onPress={() => submit("Draft")}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
252	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (onPress={() => submit("Draft")}); it is not a standalone business operation.
253	`<Button title="SUBMIT SURVEY" disabled={saving} onPress={() => submit("Completed")} />`	Renders/opens a UI element or component: <Button title="SUBMIT SURVEY" disabled={saving} onPress={() => submit("Completed")} />. Props and child content below determine appearance and interactions.
254	`</Card>`	Closes the UI element/component opened above.
255	`)}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
256	`</ScrollView>`	Closes the UI element/component opened above.
257	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
258	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
259	`const s = StyleSheet.create({`	Declares/initializes local data used by the surrounding operation: const s = StyleSheet.create({. Collection contents and assignments below determine its purpose.

sales-rep-mobile/mobile/src/storage/primaryQueue.test.ts

Regression tests for primaryQueue. Fixture setup creates inputs, the action invokes behavior, and assertions compare actual results to expected outcomes. Tests with stubs do not verify the real mail provider or Salesforce transport.

1	`import React, { useEffect, useRef, useState } from "react";`	Imports dependencies/types used below: import React, { useEffect, useRef, useState } from "react";. Importing a function does not call it.
2	`import {`	Imports dependencies/types used below: import {. Importing a function does not call it.
3	`  AppState,`	Continues the surrounding declaration/expression or text: AppState,. Read it with the preceding opening statement (import {); it is not a standalone business operation.
4	`  Platform,`	Continues the surrounding declaration/expression or text: Platform,. Read it with the preceding opening statement (AppState,); it is not a standalone business operation.
5	`  SafeAreaView,`	Continues the surrounding declaration/expression or text: SafeAreaView,. Read it with the preceding opening statement (Platform,); it is not a standalone business operation.
6	`  ScrollView,`	Continues the surrounding declaration/expression or text: ScrollView,. Read it with the preceding opening statement (SafeAreaView,); it is not a standalone business operation.
7	`  View,`	Continues the surrounding declaration/expression or text: View,. Read it with the preceding opening statement (ScrollView,); it is not a standalone business operation.
8	`  Text,`	Continues the surrounding declaration/expression or text: Text,. Read it with the preceding opening statement (View,); it is not a standalone business operation.
9	`  TextInput,`	Continues the surrounding declaration/expression or text: TextInput,. Read it with the preceding opening statement (Text,); it is not a standalone business operation.
10	`  Pressable,`	Continues the surrounding declaration/expression or text: Pressable,. Read it with the preceding opening statement (TextInput,); it is not a standalone business operation.
11	`  StyleSheet,`	Continues the surrounding declaration/expression or text: StyleSheet,. Read it with the preceding opening statement (Pressable,); it is not a standalone business operation.
12	`} from "react-native";`	Completes the dependency import and identifies the module supplying those names.

Line	Source code	Explanation / reading note
13	`import * as Crypto from "expo-crypto";`	Imports dependencies/types used below: import * as Crypto from "expo-crypto";. Importing a function does not call it.
14	`import { request, ApiError } from "./api";`	Imports dependencies/types used below: import { request, ApiError } from "./api";. Importing a function does not call it.
15	`import { colors } from "./theme";`	Imports dependencies/types used below: import { colors } from "./theme";. Importing a function does not call it.
16	`import { validateGoodsReceipt } from "./goodsReceipt";`	Imports dependencies/types used below: import { validateGoodsReceipt } from "./goodsReceipt";. Importing a function does not call it.
17	`import PurchasesSalesDashboard from "./components/PurchasesSalesDashboard";`	Imports dependencies/types used below: import PurchasesSalesDashboard from "./components/PurchasesSalesDashboard";. Importing a function does not call it.
18	`import ManagementReports from "./components/ManagementReports";`	Imports dependencies/types used below: import ManagementReports from "./components/ManagementReports";. Importing a function does not call it.
19	`import PrimaryOrderForm from "./components/PrimaryOrderForm";`	Imports dependencies/types used below: import PrimaryOrderForm from "./components/PrimaryOrderForm";. Importing a function does not call it.
20	`import PortalFrame from "./components/PortalFrame";`	Imports dependencies/types used below: import PortalFrame from "./components/PortalFrame";. Importing a function does not call it.
21	`import BrandLogo from "./components/BrandLogo";`	Imports dependencies/types used below: import BrandLogo from "./components/BrandLogo";. Importing a function does not call it.
22	`import { MetricCard, MenuItem } from "./components/Workspace";`	Imports dependencies/types used below: import { MetricCard, MenuItem } from "./components/Workspace";. Importing a function does not call it.
23	`import {`	Imports dependencies/types used below: import {. Importing a function does not call it.
24	`  Session,`	Continues the surrounding declaration/expression or text: Session,. Read it with the preceding opening statement (import {); it is not a standalone business operation.
25	`  Pending,`	Continues the surrounding declaration/expression or text: Pending,. Read it with the preceding opening statement (Session,); it is not a standalone business operation.
26	`  readSession,`	Continues the surrounding declaration/expression or text: readSession,. Read it with the preceding opening statement (Pending,); it is not a standalone business operation.
27	`  saveSession,`	Continues the surrounding declaration/expression or text: saveSession,. Read it with the preceding opening statement (readSession,); it is not a standalone business operation.

Line	Source code	Explanation / reading note
28	`  readSnapshot,`	Continues the surrounding declaration/expression or text: readSnapshot,. Read it with the preceding opening statement (saveSession,); it is not a standalone business operation.
29	`  saveSnapshot,`	Continues the surrounding declaration/expression or text: saveSnapshot,. Read it with the preceding opening statement (readSnapshot,); it is not a standalone business operation.
30	`  readPending,`	Continues the surrounding declaration/expression or text: readPending,. Read it with the preceding opening statement (saveSnapshot,); it is not a standalone business operation.
31	`  savePending,`	Continues the surrounding declaration/expression or text: savePending,. Read it with the preceding opening statement (readPending,); it is not a standalone business operation.
32	`} from "./storage";`	Completes the dependency import and identifies the module supplying those names.
33		Blank line separating logical sections; no executable operation.
34	`type Row = Record<string, any>;`	Defines a compile-time data contract: type Row = Record<string, any>;. TypeScript types do not validate untrusted runtime JSON by themselves.
35	`type Snapshot = {`	Defines a compile-time data contract: type Snapshot = {. TypeScript types do not validate untrusted runtime JSON by themselves.
36	`  distributor: Row;`	Sets/declares the named object property or style/type member: distributor: Row;. Interpret it in the enclosing object, props or type definition.
37	`  retrievedAt: string;`	Sets/declares the named object property or style/type member: retrievedAt: string;. Interpret it in the enclosing object, props or type definition.
38	`  truncatedLists: string[];`	Sets/declares the named object property or style/type member: truncatedLists: string[];. Interpret it in the enclosing object, props or type definition.
39	`  [key: string]: any;`	Continues the surrounding declaration/expression or text: [key: string]: any;. Read it with the preceding opening statement (truncatedLists: string[];); it is not a standalone business operation.
40	`};`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
41	`const money = (value: any) => `₹${Number(value || 0).toFixed(2)}`;`	Declares/initializes local data used by the surrounding operation: const money = (value: any) => `₹${Number(value || 0).toFixed(2)}`;. Collection contents and assignments below determine its purpose.

Line	Source code	Explanation / reading note
42	`const sum = (rows: Row[], field: string) =>`	Declares/initializes local data used by the surrounding operation: const sum = (rows: Row[], field: string) =>. Collection contents and assignments below determine its purpose.
43	`  rows.reduce((total, row) => total + Number(row[field] || 0), 0);`	Transforms/selects/aggregates collection values with the callback shown here: rows.reduce((total, row) => total + Number(row[field] || 0), 0);. Read the callback body and result assignment together.
44		Blank line separating logical sections; no executable operation.
45	`function Field({`	Declares a callable function/method: function Field({. Parameters supply its inputs; the following block implements the operation.
46	`  label,`	Continues the surrounding declaration/expression or text: label,. Read it with the preceding opening statement (function Field({); it is not a standalone business operation.
47	`  value,`	Continues the surrounding declaration/expression or text: value,. Read it with the preceding opening statement (label,); it is not a standalone business operation.
48	`  onChange,`	Continues the surrounding declaration/expression or text: onChange,. Read it with the preceding opening statement (value,); it is not a standalone business operation.
49	`  numeric = false,`	Assigns the right-hand expression to the named variable/property: numeric = false,. This is in-memory unless it is later persisted by an explicit call.
50	`  multiline = false,`	Assigns the right-hand expression to the named variable/property: multiline = false,. This is in-memory unless it is later persisted by an explicit call.
51	`}: {`	Continues the surrounding declaration/expression or text: }: {. Read it with the preceding opening statement (multiline = false,); it is not a standalone business operation.
52	`  label: string;`	Sets/declares the named object property or style/type member: label: string;. Interpret it in the enclosing object, props or type definition.
53	`  value: string;`	Sets/declares the named object property or style/type member: value: string;. Interpret it in the enclosing object, props or type definition.
54	`  onChange: (value: string) => void;`	Sets/declares the named object property or style/type member: onChange: (value: string) => void;. Interpret it in the enclosing object, props or type definition.
55	`  numeric?: boolean;`	Sets/declares the named object property or style/type member: numeric?: boolean;. Interpret it in the enclosing object, props or type definition.

Line	Source code	Explanation / reading note
56	`  multiline?: boolean;`	Sets/declares the named object property or style/type member: multiline?: boolean;. Interpret it in the enclosing object, props or type definition.
57	`}) {`	Continues the surrounding declaration/expression or text: }) {. Read it with the preceding opening statement (multiline?: boolean;); it is not a standalone business operation.
58	`  return (`	Returns (to the caller (or begins returned UI markup) and ends this execution path.
59	`    <View>`	Renders/opens a UI element or component: <View>. Props and child content below determine appearance and interactions.
60	`      <Text style={styles.label}>{label}</Text>`	Renders/opens a UI element or component: <Text style={styles.label}>{label}</Text>. Props and child content below determine appearance and interactions.
61	`      <TextInput`	Renders/opens a UI element or component: <TextInput. Props and child content below determine appearance and interactions.
62	`        accessibilityLabel={label}`	Assigns the right-hand expression to the named variable/property: accessibilityLabel={label}. This is in-memory unless it is later persisted by an explicit call.
63	`        value={value}`	Assigns the right-hand expression to the named variable/property: value={value}. This is in-memory unless it is later persisted by an explicit call.
64	`        onChangeText={onChange}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
65	`        placeholder={label}`	Assigns the right-hand expression to the named variable/property: placeholder={label}. This is in-memory unless it is later persisted by an explicit call.
66	`        placeholderTextColor="#607970"`	Assigns the right-hand expression to the named variable/property: placeholderTextColor="#607970". This is in-memory unless it is later persisted by an explicit call.
67	`        keyboardType={numeric ? "numeric" : "default"}`	Assigns the right-hand expression to the named variable/property: keyboardType={numeric ? "numeric" : "default"}. This is in-memory unless it is later persisted by an explicit call.
68	`        autoCapitalize="none"`	Assigns the right-hand expression to the named variable/property: autoCapitalize="none". This is in-memory unless it is later persisted by an explicit call.
69	`        multiline={multiline}`	Assigns the right-hand expression to the named variable/property: multiline={multiline}. This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
70	`style={[styles.input, multiline && { minHeight: 90, textAlignVertical: "top" }]}`	Assigns the right-hand expression to the named variable/property: style={[styles.input, multiline && { minHeight: 90, textAlignVertical: "top" }]}. This is in-memory unless it is later persisted by an explicit call.
71	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (style={[styles.input, multiline && { minHeight: 90, textAlignVertical: "top" }]}); it is not a standalone business operation.
72	`</View>`	Closes the UI element/component opened above.
73	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
74	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
75	`function Button({`	Declares a callable function/method: function Button({. Parameters supply its inputs; the following block implements the operation.
76	`title,`	Continues the surrounding declaration/expression or text: title,. Read it with the preceding opening statement (function Button({); it is not a standalone business operation.
77	`onPress,`	Continues the surrounding declaration/expression or text: onPress,. Read it with the preceding opening statement (title,); it is not a standalone business operation.
78	`disabled = false,`	Assigns the right-hand expression to the named variable/property: disabled = false,. This is in-memory unless it is later persisted by an explicit call.
79	`secondary = false,`	Assigns the right-hand expression to the named variable/property: secondary = false,. This is in-memory unless it is later persisted by an explicit call.
80	`}: {`	Continues the surrounding declaration/expression or text: }: {. Read it with the preceding opening statement (secondary = false,); it is not a standalone business operation.
81	`title: string;`	Sets/declares the named object property or style/type member: title: string;. Interpret it in the enclosing object, props or type definition.
82	`onPress: () => void;`	Sets/declares the named object property or style/type member: onPress: () => void;. Interpret it in the enclosing object, props or type definition.
83	`disabled?: boolean;`	Sets/declares the named object property or style/type member: disabled?: boolean;. Interpret it in the enclosing object, props or type definition.

Line	Source code	Explanation / reading note
84	`  secondary?: boolean;`	Sets/declares the named object property or style/type member: secondary?: boolean;. Interpret it in the enclosing object, props or type definition.
85	`}) {`	Continues the surrounding declaration/expression or text: }) {. Read it with the preceding opening statement (secondary?: boolean;); it is not a standalone business operation.
86	`  return (`	Returns (to the caller (or begins returned UI markup) and ends this execution path.
87	`    <Pressable`	Renders/opens a UI element or component: <Pressable. Props and child content below determine appearance and interactions.
88	`      accessibilityRole="button"`	Assigns the right-hand expression to the named variable/property: accessibilityRole="button". This is in-memory unless it is later persisted by an explicit call.
89	`      accessibilityState={{ disabled }}`	Assigns the right-hand expression to the named variable/property: accessibilityState={{ disabled }}. This is in-memory unless it is later persisted by an explicit call.
90	`      disabled={disabled}`	Controls whether this button/input accepts interaction. Evaluate this expression when diagnosing an unclickable control.
91	`      onPress={onPress}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
92	`      style={[styles.button, secondary && styles.secondary, disabled && { opacity: 0.5 }]}`	Assigns the right-hand expression to the named variable/property: style={[styles.button, secondary && styles.secondary, disabled && { opacity: 0.5 }]}. This is in-memory unless it is later persisted by an explicit call.
93	`    >`	Continues the surrounding declaration/expression or text: >. Read it with the preceding opening statement (style={[styles.button, secondary && styles.secondary, disabled && { opacity: 0.5 }]}); it is not a standalone business operation.
94	`      <Text style={[styles.buttonText, secondary && { color: "#19463e" }]}>{title}</Text>`	Renders/opens a UI element or component: <Text style={[styles.buttonText, secondary && { color: "#19463e" }]}>{title}</Text>. Props and child content below determine appearance and interactions.
95	`    </Pressable>`	Closes the UI element/component opened above.
96	`  );`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
97	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

Line	Source code	Explanation / reading note
98	`const Card = ({ children }: { children: React.ReactNode }) => (`	Declares/initializes local data used by the surrounding operation: const Card = ({ children }: { children: React.ReactNode }) => (. Collection contents and assignments below determine its purpose.
99	`  <View style={styles.card}>{children}</View>`	Renders/opens a UI element or component: <View style={styles.card}>{children}</View>. Props and child content below determine appearance and interactions.
100	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
101		Blank line separating logical sections; no executable operation.
102	`export default function DmsApp() {`	Declares a callable function/method: export default function DmsApp() {. Parameters supply its inputs; the following block implements the operation.
103	`  const [session, setSession] = useState<Session | null>(null),`	Declares/uses React render state. Its setter schedules a re-render; it does not save a Salesforce record by itself.
104	`    [data, setData] = useState<Snapshot | null>(null);`	Declares/uses React render state. Its setter schedules a re-render; it does not save a Salesforce record by itself.

1136	`<Text>Handled by your company officer / Salesforce administrator.</Text>`	Renders/opens a UI element or component: <Text>Handled by your company officer / Salesforce administrator.</Text>. Props and child content below determine appearance and interactions.
1137	`<Text style={styles.smallCopy}>`	Renders/opens a UI element or component: <Text style={styles.smallCopy}>. Props and child content below determine appearance and interactions.
1138	`Open → In Progress (approved) → Closed (resolved), or Rejected with a reason.`	Continues the surrounding declaration/expression or text: Open → In Progress (approved) → Closed (resolved), or Rejected with a reason.. Read it with the preceding opening statement (<Text style={styles.smallCopy}>); it is not a standalone business operation.
1139	`</Text>`	Closes the UI element/component opened above.
1140	`<View style={styles.tabs}>`	Renders/opens a UI element or component: <View style={styles.tabs}>. Props and child content below determine appearance and interactions.
1141	`{["Product", "Portal", "Delivery"].map((value) => (`	Transforms/selects/aggregates collection values with the callback shown here: {["Product", "Portal", "Delivery"].map((value) => (. Read the callback body and result assignment together.
1142	`<Button`	Renders/opens a UI element or component: <Button. Props and child content below determine appearance and interactions.
1143	`key={value}`	Assigns the right-hand expression to the named variable/property: key={value}. This is in-memory unless it is later persisted by an explicit call.
1144	`title={value}`	Assigns the right-hand expression to the named variable/property: title={value}. This is in-memory unless it is later persisted by an explicit call.
1145	`secondary={category !== value}`	Assigns the right-hand expression to the named variable/property: secondary={category !== value}. This is in-memory unless it is later persisted by an explicit call.
1146	`onPress={() => setCategory(value)}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
1147	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (onPress={() => setCategory(value)}); it is not a standalone business operation.
1148	`))}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

Line	Source code	Explanation / reading note
1149	`</View>`	Closes the UI element/component opened above.
1150	`<Field label="Subject" value={subject} onChange={setSubject} />`	Renders/opens a UI element or component: <Field label="Subject" value={subject} onChange={setSubject} />. Props and child content below determine appearance and interactions.
1151	`<Field`	Renders/opens a UI element or component: <Field. Props and child content below determine appearance and interactions.
1152	`label="Issue description"`	Assigns the right-hand expression to the named variable/property: label="Issue description". This is in-memory unless it is later persisted by an explicit call.
1153	`value={description}`	Assigns the right-hand expression to the named variable/property: value={description}. This is in-memory unless it is later persisted by an explicit call.
1154	`onChange={setDescription}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
1155	`multiline`	Continues the surrounding declaration/expression or text: multiline. Read it with the preceding opening statement (onChange={setDescription}); it is not a standalone business operation.
1156	`/>`	Continues the surrounding declaration/expression or text: />. Read it with the preceding opening statement (multiline); it is not a standalone business operation.
1157	`<Button`	Renders/opens a UI element or component: <Button. Props and child content below determine appearance and interactions.
1158	`title="Review ticket"`	Assigns the right-hand expression to the named variable/property: title="Review ticket". This is in-memory unless it is later persisted by an explicit call.
1159	`disabled={busy}`	Controls whether this button/input accepts interaction. Evaluate this expression when diagnosing an unclickable control.
1160	`onPress={() => {`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
1161	`if (!subject.trim() || !description.trim()) {`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!subject.trim() || !description.trim()) {.

Line	Source code	Explanation / reading note
1162	`setNotice("Enter the subject and description.");`	Continues the surrounding declaration/expression or text: setNotice("Enter the subject and description.");. Read it with the preceding opening statement (if (!subject.trim() || !description.trim()) {); it is not a standalone business operation.
1163	`return;`	Returns to the caller (or begins returned UI markup) and ends this execution path.
1164	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
1165	`setConfirm({`	Continues the surrounding declaration/expression or text: setConfirm({. Read it with the preceding opening statement (}); it is not a standalone business operation.
1166	`label: "Create support ticket",`	Sets/declares the named object property or style/type member: label: "Create support ticket",. Interpret it in the enclosing object, props or type definition.
1167	`path: "/tickets",`	Sets/declares the named object property or style/type member: path: "/tickets",. Interpret it in the enclosing object, props or type definition.
1168	`body: {`	Sets/declares the named object property or style/type member: body: {. Interpret it in the enclosing object, props or type definition.
1169	`subject: subject.trim(),`	Sets/declares the named object property or style/type member: subject: subject.trim(),. Interpret it in the enclosing object, props or type definition.
1170	`category,`	Continues the surrounding declaration/expression or text: category,. Read it with the preceding opening statement (subject: subject.trim(),); it is not a standalone business operation.
1171	`description: description.trim(),`	Sets/declares the named object property or style/type member: description: description.trim(),. Interpret it in the enclosing object, props or type definition.
1172	`},`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
1173	`});`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
1174	`}}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

24	`  const [loading, setLoading] = useState(false);`	Declares/uses React render state. Its setter schedules a re-render; it does not save a Salesforce record by itself.
25	`  const [needsSignIn, setNeedsSignIn] = useState(false);`	Declares/uses React render state. Its setter schedules a re-render; it does not save a Salesforce record by itself.
26	`  async function load() {`	Declares a callable function/method: async function load() {. Parameters supply its inputs; the following block implements the operation.

Line	Source code	Explanation / reading note
27	`    setLoading(true);`	Continues the surrounding declaration/expression or text: setLoading(true);. Read it with the preceding opening statement (async function load() {); it is not a standalone business operation.
28	`    setError("");`	Continues the surrounding declaration/expression or text: setError("");. Read it with the preceding opening statement (setLoading(true);); it is not a standalone business operation.
29	`    try {`	Starts operations whose failure is handled by the following catch/finally blocks.
30	`      setCatalogue(await request("/primary/catalogue", token));`	Waits for this asynchronous operation before continuing: setCatalogue(await request("/primary/catalogue", token));. The returned result/error must still be handled.
31	`      setNeedsSignIn(false);`	Continues the surrounding declaration/expression or text: setNeedsSignIn(false);. Read it with the preceding opening statement (setCatalogue(await request("/primary/catalogue", token));); it is not a standalone business operation.
32	`    } catch (failure: any) {`	Handles an exception from the preceding try block. Check whether it rolls back, preserves queued work or only displays an error.
33	`      setCatalogue(null);`	Continues the surrounding declaration/expression or text: setCatalogue(null);. Read it with the preceding opening statement (} catch (failure: any) {); it is not a standalone business operation.
34	`      setError(failure.message);`	Continues the surrounding declaration/expression or text: setError(failure.message);. Read it with the preceding opening statement (setCatalogue(null);); it is not a standalone business operation.
35	`      setNeedsSignIn(failure.status === 401 || failure.status === 403);`	Continues the surrounding declaration/expression or text: setNeedsSignIn(failure.status === 401 || failure.status === 403);. Read it with the preceding opening statement (setError(failure.message);); it is not a standalone business operation.
36	`    } finally {`	Cleanup section that runs after success or failure, for example clearing a timer or busy flag.
37	`      setLoading(false);`	Continues the surrounding declaration/expression or text: setLoading(false);. Read it with the preceding opening statement (} finally {); it is not a standalone business operation.
38	`    }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
39	`  }`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

Line	Source code	Explanation / reading note
40	`  useEffect(() => {`	Registers a lifecycle effect. Read its dependency array and cleanup to understand when it runs or is cancelled.
41	`    void load();`	Continues the surrounding declaration/expression or text: void load();. Read it with the preceding opening statement (useEffect(() => {); it is not a standalone business operation.
42	`  }, [token]);`	Continues the surrounding declaration/expression or text: }, [token]);. Read it with the preceding opening statement (void load();); it is not a standalone business operation.
43	`  const products: Row[] = catalogue?.products || [];`	Declares/initializes local data used by the surrounding operation: const products: Row[] = catalogue?.products || [];. Collection contents and assignments below determine its purpose.
44	`  const chosen = products.filter((p) => selected[p.Id]);`	Declares/initializes local data used by the surrounding operation: const chosen = products.filter((p) => selected[p.Id]);. Collection contents and assignments below determine its purpose.
45	`  const configured = (p: Row) =>`	Declares/initializes local data used by the surrounding operation: const configured = (p: Row) =>. Collection contents and assignments below determine its purpose.
46	`    Number(p.DMS_Case_Price__c) > 0 &&`	Continues the surrounding declaration/expression or text: Number(p.DMS_Case_Price__c) > 0 &&. Read it with the preceding opening statement (const configured = (p: Row) =>); it is not a standalone business operation.
47	`    Number.isInteger(Number(p.Units_Per_Case__c)) &&`	Calls the named method: Number.isInteger(Number(p.Units_Per_Case__c)) &&. Its implementation defines the side effect/result; use the symbol/file index to follow it.
48	`    Number(p.Units_Per_Case__c) > 0;`	Continues the surrounding declaration/expression or text: Number(p.Units_Per_Case__c) > 0;. Read it with the preceding opening statement (Number.isInteger(Number(p.Units_Per_Case__c)) &&); it is not a standalone business operation.
49	`  const button = (title: string, action: () => void, blocked = false, checked = false) => (`	Declares/initializes local data used by the surrounding operation: const button = (title: string, action: () => void, blocked = false, checked = false) => (. Collection contents and assignments below determine its purpose.
50	`    <Pressable`	Renders/opens a UI element or component: <Pressable. Props and child content below determine appearance and interactions.
51	`      accessibilityRole="button"`	Assigns the right-hand expression to the named variable/property: accessibilityRole="button". This is in-memory unless it is later persisted by an explicit call.

Line	Source code	Explanation / reading note
52	`accessibilityState={{ disabled: blocked, selected: checked }}`	Assigns the right-hand expression to the named variable/property: accessibilityState={{ disabled: blocked, selected: checked }}. This is in-memory unless it is later persisted by an explicit call.
53	`disabled={blocked}`	Controls whether this button/input accepts interaction. Evaluate this expression when diagnosing an unclickable control.
54	`onPress={action}`	Binds a UI interaction to the referenced handler; trace that handler to see whether it edits state, validates or calls the backend.
55	`style={[s.button, checked && s.selected, blocked && { opacity: 0.5 }]}`	Assigns the right-hand expression to the named variable/property: style={[s.button, checked && s.selected, blocked && { opacity: 0.5 }]}. This is in-memory unless it is later persisted by an explicit call.
56	`>`	Continues the surrounding declaration/expression or text: >. Read it with the preceding opening statement (style={[s.button, checked && s.selected, blocked && { opacity: 0.5 }]}); it is not a standalone business operation.
57	`<Text style={[s.buttonText, checked && { color: colors.white }]}>{title}</Text>`	Renders/opens a UI element or component: <Text style={[s.buttonText, checked && { color: colors.white }]}>{title}</Text>. Props and child content below determine appearance and interactions.
58	`</Pressable>`	Closes the UI element/component opened above.
59	`);`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
60	`function review() {`	Declares a callable function/method: function review() {. Parameters supply its inputs; the following block implements the operation.
61	`if (!chosen.length || chosen.length > 50 || chosen.length !== Object.keys(selected).length) {`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!chosen.length || chosen.length > 50 || chosen.length !== Object.keys(selected).length) {.
62	`setError(`	Continues the surrounding declaration/expression or text: setError(. Read it with the preceding opening statement (if (!chosen.length || chosen.length > 50 || chosen.length !== Object.keys(selected).length) {); it is not a standalone business operation.
63	`"Select between 1 and 50 current products. A removed product requires reopening the form.",`	Continues the surrounding declaration/expression or text: "Select between 1 and 50 current products. A removed product requires reopening the form.",. Read it with the preceding opening statement (setError(); it is not a standalone business operation.

27	`  const quantity = Number(cases);`	Declares/initializes local data used by the surrounding operation: const quantity = Number(cases);. Collection contents and assignments below determine its purpose.
28	`  if (!Number.isInteger(quantity) || quantity <= 0 || quantity > 100000)`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!Number.isInteger(quantity) || quantity <= 0 || quantity > 100000).
29	`    return { error: "Enter received cases as a whole number between 1 and 100,000." };`	Returns { error: "Enter received cases as a whole number between 1 and 100,000." } to the caller (or begins returned UI markup) and ends this execution path.
30	`  if (approvedCases !== undefined && (!Number.isFinite(approvedCases) || approvedCases <= 0))`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (approvedCases !== undefined && (!Number.isFinite(approvedCases) || approvedCases <= 0)).
31	`    return {`	Returns { to the caller (or begins returned UI markup) and ends this execution path.
32	`      error:`	Sets/declares the named object property or style/type member: error:. Interpret it in the enclosing object, props or type definition.
33	`        "No approved cases are available for this receipt. Refresh the order before continuing.",`	Continues the surrounding declaration/expression or text: "No approved cases are available for this receipt. Refresh the order before continuing.",. Read it with the preceding opening statement (error:); it is not a standalone business operation.
34	`    };`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.
35	`  if (approvedCases !== undefined && quantity > approvedCases)`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (approvedCases !== undefined && quantity > approvedCases).
36	`    return {`	Returns { to the caller (or begins returned UI markup) and ends this execution path.
37	`      error: \`This order approves ${approvedCases} case(s), but you entered ${quantity}. Enter only the cases actually delivered, within the approved quantity. Salesforce also checks any previous receipts.\`,`	Sets/declares the named object property or style/type member: error: `This order approves ${approvedCases} case(s), but you entered ${quantity}. Enter only the cases actually delivered, within the approved quantity. Salesforce also checks any previous receipts.`. Interpret it in the enclosing object, props or type definition.
38	`    };`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

Line	Source code	Explanation / reading note
39	`  if (!batch.trim() || batch.trim().length > 80)`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!batch.trim() || batch.trim().length > 80).
40	`    return { error: "Enter a batch number of 1–80 characters." };`	Returns { error: "Enter a batch number of 1-80 characters." } to the caller (or begins returned UI markup) and ends this execution path.
41	`  const date = receiptExpiry(expiry);`	Declares/initializes local data used by the surrounding operation: const date = receiptExpiry(expiry);. Collection contents and assignments below determine its purpose.
42	`  if (!date) return { error: "Enter a valid expiry date, for example 2026-12-14 or 14-12-2026." };`	Conditional branch: execute the following statement/block only when this Boolean expression is true. Condition begins: if (!date) return { error: "Enter a valid expiry date, for example 2026-12-14 or 14-12-2026." };.
43	`  return { value: { cases: quantity, batch: batch.trim(), expiry: date } };`	Returns { value: { cases: quantity, batch: batch.trim(), expiry: date } } to the caller (or begins returned UI markup) and ends this execution path.
44	`}`	Closes the surrounding block, call, array or object. Match it to the opening statement above; no independent business action.

dms-mobile/src/storage.ts

DMS persistence helpers: platform-appropriate session storage and distributor-specific snapshot/pending keys. Storage itself does not send records to Salesforce.

56 numbered source lines | SHA-256 c35ae2ef6dd25ed7f9bd30d0d89fb8a98453a43395b4c016f65d3a3335934023
